# ON A POWER OF RELATIONAL STRUCTURES 

Vítězslav Novák, Brno

(Received May 28, 1984)

The aim of this paper is to define direct operations and an operation of a power for relational structures and to prove their properties. In particular, a power satisfies the expected rules with the exception of $\left(\boldsymbol{G}^{\boldsymbol{H}}\right)^{\boldsymbol{K}} \simeq \boldsymbol{G}^{\boldsymbol{H} \cdot \boldsymbol{K}}$. We derive sufficient conditions for the validity of that law.

1. Let $I \neq \emptyset$ be a set, let $n_{i}$ be a positive integer for any $i \in I$. A family $\left(n_{i} ; i \in I\right)$ will be called a type. The types $\left(n_{i} ; i \in I\right),\left(m_{j} ; j \in J\right)$ are similar iff there exists a bijection $\varphi: I \rightarrow J$ such that $m_{\varphi(t)}=n_{i}$ for all $i \in I$.
2. Definition. Let $G \neq \emptyset$ be a set, let $\left(n_{i} ; i \in I\right)$ be a type. Let $C_{i}$ be an $n_{i}$-ary relation on the set $G$ for any $i \in I$, i.e. $C_{i} \cong G^{n_{i}}$. Then $\boldsymbol{G}=\left(G,\left(C_{i} ; i \in I\right)\right)$ is called a relational structure of type $\left(n_{i} ; i \in I\right)$.

If $\boldsymbol{G}=\left(G,\left(C_{i} ; i \in I\right)\right)$ is a relational structure, then the set $G$ is called a carrier of $\boldsymbol{G}$ and $C_{i}$ are called relations of $\boldsymbol{G}$. Sometimes we denote by $\mathscr{R}_{i}(\boldsymbol{G})$ the $i^{\text {th }}$ relation of $\boldsymbol{G}=\left(G,\left(C_{i} ; i \in I\right)\right)$, i.e. $\mathscr{R}_{i}(\boldsymbol{G})=C_{i}$.

Two relational structures $\boldsymbol{G}=\left(G,\left(C_{i} ; i \in I\right)\right)$ and $\boldsymbol{H}=\left(H,\left(D_{j} ; j \in J\right)\right)$ of types $\left(n_{i} ; i \in I\right)$ and $\left(m_{j} ; j \in J\right)$, respectively, are called similar iff their types $\left(n_{i} ; i \in I\right)$ and $\left(m_{j} ; j \in J\right)$ are similar.

If $\boldsymbol{G}=\left(G,\left(C_{c} ; i \in I\right), \boldsymbol{H}=\left(H,\left(D_{j} ; j \in J\right)\right)\right.$ are similar relational structures, then we can assume without loss of generality that $I=J$ and that the mapping $\varphi$ in Sec. 1 is an identity on $I$, i.e. that $m_{i}=n_{i}$ for all $i \in I$.
3. Definition. Let $\boldsymbol{G}=\left(G,\left(C_{i} ; i \in I\right)\right), \boldsymbol{H}=\left(H,\left(D_{i} ; i \in I\right)\right)$ be similar relational structures of type $\left(n_{i} ; i \in I\right)$. Let $f: G \rightarrow H$ be a mapping which has the following property: for any $i \in I$ and any $x_{1}, \ldots, x_{n_{i}} \in G$ the implication $\left(x_{1}, \ldots, x_{n_{i}}\right) \in C_{i} \Rightarrow$ $\Rightarrow\left(f\left(x_{1}\right), \ldots, f\left(x_{n_{i}}\right)\right) \in D_{i}$ holds. Then $f$ is called a homomorphism of the relational structure $\boldsymbol{G}$ into the relational structure $\boldsymbol{H}$.

We denote by $\operatorname{Hom}(\boldsymbol{G}, \boldsymbol{H})$ the set of all homomorphisms of $\boldsymbol{G}$ into $\boldsymbol{H}$.
A bijective homomorphism $f$ of $\boldsymbol{G}$ onto $\boldsymbol{H}$ such that $f^{-1}$ is a homomorphism of $\boldsymbol{H}$ onto $\boldsymbol{G}$ is called an isomorphism of $\boldsymbol{G}$ onto $\boldsymbol{H}$. Two similar relational structures $\boldsymbol{G}, \boldsymbol{H}$ are called isomorphic iff there exists an isomorphism of $\boldsymbol{G}$ onto $\boldsymbol{H}$; in that case we write $\boldsymbol{G} \simeq \boldsymbol{H}$.
4. Definition. Let $K \neq \emptyset$ be a set, let $\left(\boldsymbol{G}_{\boldsymbol{k}} ; k \in K\right)$ be a family of similar relational structures of type $\left(n_{i} ; i \in I\right)$. Let $\boldsymbol{G}_{k}=\left(G_{k},\left(C_{i k} ; i \in I\right)\right)$ for any $k \in K$ and let $G_{k_{1}} \cap G_{k_{2}}=\emptyset$ for $k_{1}, k_{2} \in K, k_{1} \neq k_{2}$. The direct sum $\sum_{k \in K} \boldsymbol{G}_{k}$ of the family $\left(\boldsymbol{G}_{k} ; k \in K\right)$ is the relational structure $\boldsymbol{G}=\left(G,\left(C_{i} ; i \in I\right)\right)$ of type $\left(n_{i} ; i \in I\right)$ for which $G=\bigcup_{k \in K} G_{k}$ and $C_{i}=\bigcup_{k \in K} C_{i k}$ for any $i \in I$.
If $K=\{1, \ldots, n\}$ then we write $\sum_{k \in K} \boldsymbol{G}_{k}=\boldsymbol{G}_{1}+\ldots+\boldsymbol{G}_{n}$.
5. Remark. Let $\left(\boldsymbol{G}_{k} ; k \in K\right)=\left(\left(G_{k},\left(C_{i k} ; i \in I\right)\right) ; k \in K\right)$ be a family of similar relational structures and let $\boldsymbol{G}=\left(G,\left(C_{i} ; i \in I\right)\right)=\sum_{k \in K} \boldsymbol{G}_{k}$. Then the canonical insertion $j_{k}: G_{k} \rightarrow G$ defined by $j_{k}(x)=x$ for $x \in G_{k}$ is an isomorphic embedding of $\boldsymbol{G}_{k}$ into $\boldsymbol{G}$.
6. Let $\boldsymbol{G}=\left(G,\left(C_{i} ; i \in I\right)\right), \boldsymbol{H}=\left(G,\left(D_{i} ; i \in I\right)\right)$ be similar relational structures of type ( $n_{i} ; i \in I$ ) with the same carrier $G$. Put $\boldsymbol{G} \prec \boldsymbol{H}$ iff $C_{i} \subseteq D_{i}$ for all $i \in I$. Clearly $\prec$ is a (partial) order on the class of all relational structures of type $\left(n_{i} ; i \in I\right)$ with the same carrier $G$.
7. Lemma. Let $\left(\boldsymbol{G}_{\boldsymbol{k}} ; k \in K\right)=\left(\left(G_{k},\left(C_{i k} ; i \in I\right)\right) ; k \in K\right)$ be a family of similar relational struotures of type $\left(n_{i} ; i \in I\right)$ with $G_{k_{1}} \cap G_{k_{2}}=\emptyset$ for $k_{1} \neq k_{2}$ and let $\boldsymbol{G}=\left(G,\left(C_{i} ; i \in I\right)\right)=\sum_{k \in K} \boldsymbol{G}_{\boldsymbol{k}}$. Then $\boldsymbol{G}$ is the least element (with respect to $\prec$ ) in the class of such relational structures $\boldsymbol{H}$ of type $\left(n_{i} ; i \in I\right)$ and with carrier $G$, for which all canonical insertions $j_{k}(k \in K)$ are homomorphisms of $\boldsymbol{G}_{\boldsymbol{k}}$ into $\boldsymbol{H}$.

Proof. By Sec. 5 all canonical insertions $j_{k}: G_{k} \rightarrow G$ are homomorphisms of $\boldsymbol{G}_{k}$ into $\boldsymbol{G}$. Let $\boldsymbol{H}=\left(G,\left(D_{i} ; i \in I\right)\right)$ be a relational structure of type $\left(n_{i} ; i \in I\right)$ with carrier $G$ and such that all canonical insertions $j_{k}$ are homomorhisms of $\boldsymbol{G}_{k}$ into $\boldsymbol{H}$. Let $i \in I$ and let $x_{1}, \ldots, x_{n_{i}} \in G$ be such elements that $\left(x_{1}, \ldots, x_{n_{i}}\right) \in C_{i}$. Then there exists $k \in K$ such that $x_{1}, \ldots, x_{n_{i}} \in G_{k}$ and $\left(x_{1}, \ldots, x_{n_{i}}\right) \in C_{i k}$. By assumption then $\left(x_{1}, \ldots, x_{n_{i}}\right)=\left(j_{k}\left(x_{1}\right), \ldots, j_{k}\left(x_{n_{i}}\right)\right) \in D_{i}$. Thus $C_{i} \subseteq D_{i}$ for all $i \in I$ and $\boldsymbol{G} \prec \boldsymbol{H}$.
8. Definition. Let $K \neq \emptyset$ be a set, let $\left(G_{k} ; k \in K\right)=\left(\left(G_{k},\left(C_{i k} ; i \in I\right)\right) ; k \in K\right)$ be a family of similar relational structures of type $\left(n_{i} ; i \in I\right)$. The direct product $\prod_{k \in K} \boldsymbol{G}_{k}$ of the family $\left(\boldsymbol{G}_{\boldsymbol{k}} ; k \in K\right)$ is the relational structure $\boldsymbol{G}=\left(G,\left(C_{i} ; i \in I\right)\right)$ of type $\left(n_{i} ; i \in I\right)$ for which $G=\underset{k \in K}{X} G_{k}$ and $C_{i}=\underset{k \in K}{X} C_{i k}$ for any $i \in I$.

Note that $\underset{k \in K}{X} G_{k}$ means here the cartesian product of sets and $\underset{k \in K}{X} C_{i k}$ means the direct product of relations, i.e. if $x_{1}, \ldots, x_{n_{i}} \in \underset{k \in K}{ } G_{k}$, then $\left(x_{1}, \ldots, x_{n_{i}}\right) \in \underset{k \in K}{ } C_{i k}$ is equivalent to $\left(\operatorname{pr}_{k} x_{1}, \ldots, \operatorname{pr}_{k} x_{n_{i}}\right) \in C_{i k}$ for all $k \in K$. If $K=\{1, \ldots, n\}$, then we write $\prod_{k \in K} \boldsymbol{G}_{k}=$ $=\boldsymbol{G}_{1} \ldots \boldsymbol{G}_{n}$.
9. Lemma. Let $\left(\boldsymbol{G}_{k} ; k \in K\right)=\left(\left(G_{k},\left(C_{i k} ; i \in I\right)\right) ; k \in K\right)$ be a family of similar
relational structures of type $\left(n_{i} ; i \in I\right)$ and let $\boldsymbol{G}=\left(G,\left(C_{i} ; i \in I\right)\right)=\prod_{k \in K} \boldsymbol{G}_{\boldsymbol{k}}$. Then $\boldsymbol{G}$ is the greatest element (with respect to $\prec$ ) in the class of such relational structures $\boldsymbol{H}$ of type $\left(n_{l} ; i \in I\right)$ and with carrier $G$, for which all projections $\operatorname{pr}_{k}(k \in K)$ are homomorphisms of $\boldsymbol{H}$ onto $\boldsymbol{G}_{\boldsymbol{k}}$.

Proof. From the definition of the direct product it follows directly that any projection $\mathrm{pr}_{k}$ is a homomorphism of $\boldsymbol{G}$ onto $\boldsymbol{G}_{k}$. Let $\boldsymbol{H}=\left(G,\left(D_{i} ; i \in I\right)\right)$ be a relational structure of type $\left(n_{i} ; i \in I\right)$ and with carrier $G$ such that all projections $\operatorname{pr}_{k}(k \in K)$ are homomorphisms of $\boldsymbol{H}$ onto $\boldsymbol{G}_{k}$. Let $i \in I$ and let $x_{1}, \ldots, x_{n_{i}} \in G$ be such elements that $\left(x_{1}, \ldots, x_{n_{i}}\right) \in D_{i}$. Then by the assumption $\left(\operatorname{pr}_{k} x_{1}, \ldots, \operatorname{pr}_{k} x_{n_{i}}\right) \in C_{i k}$ for all $k \in K$ and this implies by Sec. $8\left(x_{1}, \ldots, x_{n_{i}}\right) \in C_{i}$. Thus $D_{i} \subseteq C_{i}$ for all $i \in I$ and $\boldsymbol{H} \prec \boldsymbol{G}$.
10. Definition. Let $\boldsymbol{G}=\left(G,\left(C_{i} ; i \in I\right)\right), \boldsymbol{H}=\left(H,\left(D_{i} ; i \in I\right)\right)$ be similar relational structures of type $\left(n_{i} ; i \in I\right)$. The power $\boldsymbol{G}^{\boldsymbol{H}}$ is the relational structure $\boldsymbol{K}=$ $=\left(K,\left(E_{i} ; i \in I\right)\right)$ of type $\left(n_{i} ; i \in I\right)$ for which $K=\operatorname{Hom}(\boldsymbol{H}, \boldsymbol{G})$ and for any $i \in I$, $f_{1}, \ldots, f_{n_{i}} \in K$ we have $\left(f_{1}, \ldots, f_{n_{i}}\right) \in E_{i}$ iff $\left(f_{1}(x), \ldots, f_{n_{i}}(x)\right) \in C_{i}$ for all $x \in H$.
11. Theorem. Let $K \neq \emptyset$ be a set, let $\left(\boldsymbol{G}_{k} ; k \in K\right)=\left(\left(G_{k},\left(C_{i k} ; i \in I\right)\right) ; k \in K\right)$ be a family of similar relational structures of type $\left(n_{i} ; i \in I\right)$ and let $\boldsymbol{H}=$ $=\left(H,\left(D_{i} ; i \in I\right)\right)$ be a relational structure of type $\left(n_{i} ; i \in I\right)$. Then

$$
\left(\prod_{k \in K} \boldsymbol{G}_{k}\right)^{\boldsymbol{H}} \simeq \prod_{k \in K} \boldsymbol{G}_{k}^{H}
$$

Proof. For any $f \in \operatorname{Hom}\left(\boldsymbol{H}, \prod_{k \in K} \boldsymbol{G}_{k}\right)$ and any $k \in K$ denote $f_{k}=\operatorname{pr}_{k} f$. We easily see that $f_{k} \in \operatorname{Hom}\left(\boldsymbol{H}, \boldsymbol{G}_{k}\right)$. On the other hand, if $f_{k} \in \operatorname{Hom}\left(\boldsymbol{H}, \boldsymbol{G}_{k}\right)$ for all $k \in K$, then $f={\underset{X}{X \in K}} f_{k} \in \operatorname{Hom}\left(\boldsymbol{H}, \prod_{k \in K} \boldsymbol{G}_{\boldsymbol{k}}\right)$. This shows that the correspondence $f \rightarrow\left(f_{k} ; k \in K\right)$ is a bijective mapping of $\operatorname{Hom}\left(\boldsymbol{H}, \prod_{k \in K} \boldsymbol{G}_{k}\right)$ onto $\underset{k \in K}{ } \operatorname{Hom}\left(\boldsymbol{H}, \boldsymbol{G}_{k}\right)$. We prove that this mapping is an isomorphism of $\left(\prod_{k \in K}^{k \in K} \boldsymbol{G}_{k}\right)^{\boldsymbol{H}}$ onto $\prod_{k \in K} \boldsymbol{G}_{k}^{\boldsymbol{H}}$. Let $i \in I, f_{1}, \ldots, f_{n_{i}} \in$ $\in \operatorname{Hom}\left(\boldsymbol{H}, \prod_{k \in K} \boldsymbol{G}_{k}\right)$ and $\left(f_{1}, \ldots, f_{n_{i}}\right) \in \mathscr{R}_{i}\left(\prod_{k \in K} \boldsymbol{G}_{k}\right)^{\boldsymbol{H}}$. Then $\left(f_{1}(x), \ldots, f_{n_{i}}(x)\right) \in \mathscr{R}_{i}\left(\prod_{k \in K} \boldsymbol{G}_{k}\right)$ for all $x \in H$ so that $\left(\operatorname{pr}_{k} f_{1}(x), \ldots, \operatorname{pr}_{k} f_{n_{i}}(x)\right) \in C_{i k}$ for all $k \in K$ and all $x \in H$, i.e. $\left(\left(f_{1}\right)_{k}(x), \ldots,\left(f_{n_{i}}\right)_{k}(x)\right) \in C_{i k}$ for all $k \in K$ and all $x \in H$ and this implies $\left(\left(\left(f_{1}\right)_{k}, \ldots\right.\right.$ $\left.\ldots,\left(f_{n_{i}}\right)_{k} ; k \in K\right) \in \mathscr{R}_{i}\left(\prod_{k \in K} \boldsymbol{G}_{k}^{\boldsymbol{H}}\right)$. We have shown that a mapping $f \rightarrow\left(f_{k} ; k \in K\right)=$ $=\left(\mathrm{pr}_{k} f ; k \in K\right)$ is a homomorphism of $\left(\prod_{k \in K} \boldsymbol{G}_{\boldsymbol{k}}\right)^{\boldsymbol{H}}$ onto $\prod_{k \in K} \boldsymbol{G}_{\boldsymbol{k}}^{\boldsymbol{H}}$. However, the last consideration can be reversed and thus this mapping is an isomorphism.
12. Theorem. Let $\boldsymbol{G}=\left(G,\left(C_{i} ; i \in I\right)\right.$ be a relational structure of type $\left(n_{i} ; i \in I\right)$, let $\left(\boldsymbol{H}_{k} ; k \in K\right)=\left(\left(H_{k},\left(D_{i k} ; i \in I\right) ; k \in K\right)\right.$ be a family of relational structures of type $\left(n_{i} ; i \in I\right)$ and let $H_{k_{1}} \cap H_{k_{2}}=\emptyset$ for $k_{1}, k_{2} \in K, k_{1} \neq k_{2}$. Then

$$
\boldsymbol{G}^{\sum_{\in K} \boldsymbol{H}_{k}} \simeq \prod_{k \in K} \boldsymbol{G}^{\boldsymbol{H}_{k}}
$$

Proof. Let $f \in \operatorname{Hom}\left(\sum_{k \in K} \boldsymbol{H}_{k}, \boldsymbol{G}\right)$ be any element and let $k \in K$. We denote by $f_{k}$ the restriction of $f$ onto $H_{k}$, i.e. $f_{k}=f \cap\left(H_{k} \times G\right)$. Then clearly $f_{k} \in \operatorname{Hom}\left(\boldsymbol{H}_{k}, \boldsymbol{G}\right)$. Conversely, if $f_{k} \in \operatorname{Hom}\left(\boldsymbol{H}_{k}, \boldsymbol{G}\right)$ for all $k \in K$, then $f=\bigcup_{k \in K} f_{k} \in \operatorname{Hom}\left(\sum_{k \in K} \boldsymbol{H}_{k}, \boldsymbol{G}\right)$. Thus, the correspondence $f \rightarrow\left(f_{k} ; k \in K\right)$ is a bijective mapping of the set $\operatorname{Hom}\left(\sum_{k \in K} \boldsymbol{H}_{k}, \boldsymbol{G}\right)$ onto the set $X \operatorname{Xom}\left(\boldsymbol{H}_{k}, \boldsymbol{G}\right)$. We show that this mapping is an iso$\substack{k \in K \\ \text { morphism } \\ \sum_{k} \\ \sum_{k \in K} \boldsymbol{H}_{k}}$ onto $\prod_{k \in K}^{k \in K} \boldsymbol{G}^{\boldsymbol{H}_{k}}$. Let $i \in I, f_{1}, \ldots, f_{n_{i}} \in \operatorname{Hom}\left(\sum_{k \in K} \boldsymbol{H}_{k}, \boldsymbol{G}\right)$ and $\left(f_{1}, \ldots, f_{n_{i}}\right) \in \mathscr{R}_{i}\left(\boldsymbol{G}^{\sum_{k \in K} H_{k}}\right)$. Then $\left(f_{1}(x), \ldots, f_{n_{i}}(x)\right) \in C_{i}$ for all $x \in \bigcup_{k \in K}^{k \in K} H_{k}$, so that $\left(\left(f_{1}\right)_{k}(x), \ldots,\left(f_{n_{i}}\right)_{k}(x)\right) \in C_{i}$ for all $k \in K$ and all $x \in H_{k}$, which implies $\left(\left(f_{1}\right)_{k}, \ldots\right.$ $\left.\ldots,\left(f_{n_{i}}\right)_{k}\right) \in \mathscr{R}_{i}\left(\boldsymbol{G}^{\boldsymbol{H}_{k}}\right)$ for all $k \in K$ and $\left(\left(\left(f_{1}\right)_{k}, \ldots,\left(f_{n_{i}}\right)_{k} ; k \in K\right) \in \mathscr{R}_{i}\left(\prod_{k \in K} \boldsymbol{G}^{\boldsymbol{H}_{k}}\right)\right.$. We have proved that the mapping $f \rightarrow\left(f_{k} ; k \in K\right)$ is a homomorphism of $\boldsymbol{G}^{k_{k \in K} \boldsymbol{H}_{k}}$ onto $\prod_{k \in K} \boldsymbol{G}^{\boldsymbol{H}_{\boldsymbol{k}}}$. By a reverse argument we show that the innverse mapping is a homomorphism ${ }_{k \in K}$ of $\prod_{k \in K} \boldsymbol{G}^{\boldsymbol{H}_{k}}$ onto $\boldsymbol{G}^{\boldsymbol{k}_{\boldsymbol{k} \in} \boldsymbol{H}_{k}}$ and the theorem is proved.

Let $G$ be a set and $C$ an $n$-ary relation on $G$. We call this relation weakly reflexive iff $(x, x, \ldots, x) \in C$ for any $x \in G$. Note that if $C$ is unary, then $C$ is weakly reflexive iff $C=G$ and if $C$ is binary, then weak reflexivity of $C$ denotes the reflexivity in the usual sense.
13. Theorem. Let $\boldsymbol{G}=\left(G,\left(C_{i} ; i \in I\right)\right), \boldsymbol{H}=\left(H,\left(D_{i} ; i \in I\right)\right), \boldsymbol{K}=\left(K,\left(E_{i} ; i \in I\right)\right)$ be similar relational structures of type $\left(n_{i} ; i \in I\right)$. Let all relations $D_{i}$ and all relations $E_{i}(i \in I)$ be weakly reflexive. Then there exists an isomorphic embedding of the relational structure $\boldsymbol{G}^{\boldsymbol{H} \cdot \boldsymbol{K}}$ into the relational structure $\left(\boldsymbol{G}^{\boldsymbol{H}}\right)^{\boldsymbol{K}}$.

Proof. Let $f \in \operatorname{Hom}(\boldsymbol{H}, \boldsymbol{K}, \boldsymbol{G})$ be any element, thus $f: H \times K \rightarrow G$. For any $y \in K$ denote by $f_{y}$ the mapping $f_{y}: H \rightarrow G$ defined by $f_{y}=f(\cdot, y)$, i.e. $f_{y}(x)=$ $=f(x, y)$ for $x \in H$. We show that $f_{y} \in \operatorname{Hom}(\boldsymbol{H}, \boldsymbol{G})$. Let $i \in I, x_{1}, \ldots, x_{n_{i}} \in H$ and $\left(x_{1}, \ldots, x_{n_{i}}\right) \in D_{i}$. Then $\left(\left(x_{1}, y\right), \ldots,\left(x_{n_{i}}, y\right)\right) \in \mathscr{R}_{i}(\boldsymbol{H} . \boldsymbol{K})$ so that $\left(f\left(x_{1}, y\right), \ldots\right.$ $\left.\ldots, f\left(x_{n_{i}}, y\right)\right) \in C_{i}$, i.e. $\left(f_{y}\left(x_{1}\right), \ldots, f_{y}\left(x_{n_{i}}\right)\right) \in C_{i}$. Thus, $f_{y} \in \operatorname{Hom}(\boldsymbol{H}, \boldsymbol{G})$. Further, let $x \in H$ be any element, $i \in I$ and $y_{1}, \ldots, y_{n_{i}} \in K,\left(y_{1}, \ldots, y_{n_{i}}\right) \in E_{i}$. Then $\left(\left(x, y_{1}\right), \ldots\right.$ $\left.\ldots,\left(x, y_{n_{i}}\right)\right) \in \mathscr{R}_{i}(\boldsymbol{H} . \boldsymbol{K})$ so that $\left(f\left(x, y_{1}\right), \ldots, f\left(x, y_{n_{i}}\right) \in C_{i}\right.$, i.e. $\left(f_{y_{1}}(x), \ldots, f_{y n_{i}}(x)\right) \in$ $\in C_{i}$. This shows that $\left(f_{y_{1}}, \ldots, f_{y_{i}}\right) \in \mathscr{R}_{i}\left(\boldsymbol{G}^{\boldsymbol{H}}\right)$ so that the mapping $y \rightarrow f_{y}$ is a homomorphism of $\boldsymbol{K}$ into $\boldsymbol{G}^{\boldsymbol{H}}$, i.e. an element of the set $\operatorname{Hom}\left(\boldsymbol{K}, \boldsymbol{G}^{\boldsymbol{H}}\right)$. Thus, if we write $\varphi(f)(y)=f_{y}$ for any $f \in \operatorname{Hom}(\boldsymbol{H} . \boldsymbol{K}, \boldsymbol{G})$ and any $y \in K$, then $\varphi: \operatorname{Hom}(\boldsymbol{H} . \boldsymbol{K}, \boldsymbol{G}) \rightarrow$ $\rightarrow \operatorname{Hom}\left(\boldsymbol{K}, \boldsymbol{G}^{\boldsymbol{H}}\right)$. We show that $\varphi$ is an isomorphic embedding of $\boldsymbol{G}^{\boldsymbol{H} \cdot \boldsymbol{K}}$ into $\left(G^{\boldsymbol{H}}\right)^{\boldsymbol{K}}$. Let $f, g \in \operatorname{Hom}(\boldsymbol{H} . \boldsymbol{K}, \boldsymbol{G})$ and $f \neq g$. Then there exists $(x, y) \in H \times K$ with $f(x, y) \neq g(x, y)$. Thus $f_{y}(x) \neq g_{y}(x)$ for some $y \in K$ and some $x \in H$, so that $f_{y} \neq g_{y}$ for some $y \in K$ and $\varphi(f) \neq \varphi(g)$. Hence $\varphi$ is injective. Let $i \in I, f_{1}, \ldots, f_{n_{i}} \in$ $\in \operatorname{Hom}(\boldsymbol{H}, \boldsymbol{K}, \boldsymbol{G}),\left(f_{1}, \ldots, f_{n_{i}}\right) \in \mathscr{R}_{i}\left(\boldsymbol{G}^{\boldsymbol{H} \cdot \boldsymbol{K}}\right)$. Then $\left(f_{1}(x, y), \ldots, f_{n_{i}}(x, y)\right) \in C_{\boldsymbol{i}}$ for all $(x, y) \in H \times K$, thus $\left(\left(f_{1}\right)_{y}(x), \ldots,\left(f_{n_{i}}\right)_{y}(x)\right) \in C_{i}$ for all $x \in H$ and all $y \in K$, which implies $\left(\left(f_{1}\right)_{y}, \ldots,\left(f_{n_{i}}\right)_{y}\right) \in \mathscr{R}_{i}\left(\boldsymbol{G}^{\boldsymbol{H}}\right)$ for all $y \in K$ and hence $\left(\varphi\left(f_{1}\right), \ldots, \varphi\left(f_{n_{i}}\right)\right) \in \mathscr{R}_{i}\left(\boldsymbol{G}^{\boldsymbol{H}}\right)^{\boldsymbol{K}}$.

Conversely, if $\left(\varphi\left(f_{i}\right), \ldots, \varphi\left(f_{n_{i}}\right)\right) \in \mathscr{R}_{i}\left(\left(\boldsymbol{G}^{\boldsymbol{H}}\right)^{\boldsymbol{K}}\right)$, then by the reverse argument we find that $\left(f_{1}, \ldots, f_{n_{i}}\right) \in \mathscr{R}_{i}\left(\boldsymbol{G}^{\boldsymbol{H} \cdot \boldsymbol{K}}\right)$. Thus $\varphi$ is an isomorphic embedding of $\boldsymbol{G}^{\boldsymbol{H} \cdot \boldsymbol{K}}$ into $\left(\boldsymbol{G}^{\boldsymbol{H}}\right)^{\boldsymbol{K}}$.
14. Let $G \neq \emptyset$ be a set, $C$ an $n$-ary relation on $G$. We say that $C$ has the diagonal property iff the following holds: For any family $\left(x_{t k} ; i, k=1, \ldots, n\right)$ of elements of $G$ such that $\left(x_{i 1}, x_{i 2}, \ldots, x_{i n}\right) \in C$ for all $i=1, \ldots, n$ and $\left(x_{1 k}, x_{2 k}, \ldots, x_{n k}\right) \in C$ for all $k=1, \ldots, n$ we have $\left(x_{11}, x_{22}, \ldots, x_{n n}\right) \in C$.

In other words, if in the matrix

$$
\left(\begin{array}{cccc}
x_{11} & x_{12} & \ldots & x_{1 n} \\
x_{21} & x_{22} & \ldots & x_{2 n} \\
\vdots & \vdots & & \vdots \\
x_{n 1} & x_{n 2} & \ldots & x_{n n}
\end{array}\right)
$$

all rows and all columns are in the relation $C$, then its diagonal is also in the relation $C$.
15. Examples. (1) Any unary relation on a set $G$ has the diagonal property.
(2) Let $C$ be a binary relation on a set $G$. Then $C$ has the diagonal property iff $C$ is transitive:

Proof. If $C$ is transitive and $x_{11}, x_{12}, x_{21}, x_{22} \in G$ are elements satisfying the condition in Sec. 14, then in particular $\left(x_{11}, x_{12}\right) \in C,\left(x_{12}, x_{22}\right) \in C$ and transitivity of $C$ yields $\left(x_{11}, x_{22}\right) \in C$. Conversely, if $C$ has the diagonal property and $x, y, z \in G$, $(x, y) \in C,(y, z) \in C$, then the matrix

$$
\left(\begin{array}{ll}
x & y \\
y & z
\end{array}\right)
$$

satisfies the condition of Sec. 14 and thus $(x, z) \in C$.
(3) As an example of a ternary relation with the diagonal property, let $(G,<)$ be an ordered set and let $C$ be the ternary relation on $G$ given by $(x, y, z) \in C \Leftrightarrow x<$ $<y<z$. More generally, if $C$ is a transitive binary relation on a set $G$ and $n \geqq 3$, then the $n$-ary relation $D$ on $G$ given by $\left(x_{1}, \ldots, x_{n}\right) \in D$ iff $\left(x_{i}, x_{i+1}\right) \in C$ for $i=$ $=1, \ldots, n-1$ has the diagonal property.
16. Theorem. Let $\boldsymbol{G}=\left(G,\left(C_{i} ; i \in I\right)\right), \boldsymbol{H}=\left(H,\left(D_{i} ; i \in I\right)\right), \boldsymbol{K}=\left(K,\left(E_{i} ; i \in I\right)\right)$ be similar relational structures of type $\left(n_{i} ; i \in I\right)$. Let all relations $D_{i}$ and all relations $E_{i}(i \in I)$ be weakly reflexive and let all relations $C_{i}(i \in I)$ have the diagonal property. Then $\left(\boldsymbol{G}^{\boldsymbol{H}}\right)^{\boldsymbol{K}} \simeq \boldsymbol{G}^{\boldsymbol{H} \cdot \boldsymbol{K}}$.
Proof. By the proof of Sec. 13, the mapping $\varphi: \operatorname{Hom}(\boldsymbol{H} . \boldsymbol{K}, \boldsymbol{G}) \rightarrow \operatorname{Hom}\left(\boldsymbol{K}, \boldsymbol{G}^{\boldsymbol{H}}\right)$, where $\varphi(f)(y)=f_{y}$, is an isomorphic embedding of the relational structure $\boldsymbol{G}^{\boldsymbol{H} . \boldsymbol{K}}$ into the relational structure $\left(\boldsymbol{G}^{\boldsymbol{H}}\right)^{\boldsymbol{K}}$. Thus, it suffices to show hat $\varphi$ is a surjective mapping. Let $g \in \operatorname{Hom}\left(\boldsymbol{K}, \boldsymbol{G}^{\boldsymbol{H}}\right)$ be any element. Put $f(x, y)=g(y)(x)$ for any $x \in H, y \in K$. We show that $f \in \operatorname{Hom}(\boldsymbol{H} . \boldsymbol{K}, \boldsymbol{G})$. Let $i \in I, x_{1}, \ldots, x_{n_{i}} \in H, y_{1}, \ldots, y_{n_{i}} \in$ $\in K,\left(\left(x_{1}, y_{1}\right), \ldots,\left(x_{n_{i}}, y_{n_{i}}\right) \in \mathscr{R}_{i}(\boldsymbol{H} . \boldsymbol{K})\right.$. Then $\left(x_{1}, \ldots, x_{n_{i}}\right) \in D_{i},\left(y_{1}, \ldots, y_{n_{i}}\right) \in E_{i}$ and
hence

$$
\begin{aligned}
& \left(\left(x_{j}, y_{1}\right), \ldots,\left(x_{j}, y_{n_{i}}\right)\right) \in \mathscr{R}_{i}(\boldsymbol{H} . \boldsymbol{K}) \text { for all } j=1, \ldots, n_{\cdot}, \\
& \left(\left(x_{1}, y_{k}\right), \ldots,\left(x_{n_{i}}, y_{k}\right)\right) \in \mathscr{R}_{i}(\boldsymbol{H} . \boldsymbol{K}) \text { for all } k=1, \ldots, n_{i} .
\end{aligned}
$$

As $g \in \operatorname{Hom}\left(\boldsymbol{K}, \boldsymbol{G}^{\boldsymbol{H}}\right)$, we have $\left(g\left(y_{1}\right), \ldots, g\left(y_{n_{i}}\right)\right) \in \mathscr{R}_{i}\left(\boldsymbol{G}^{\boldsymbol{H}}\right)$, so that $\left(g\left(y_{1}\right)(x), \ldots\right.$ $\left.\ldots, g\left(y_{n_{i}}\right)(x)\right) \in C_{i}$ for all $x \in H$, in particular $\left(g\left(y_{1}\right)\left(x_{j}\right), \ldots, g\left(y_{n_{i}}\right)\left(x_{j}\right)\right) \in C_{i}$ for all $j=1, \ldots, n_{i} .(*)$ Further, $g(y) \in \operatorname{Hom}(\boldsymbol{H}, \boldsymbol{G})$ for any $y \in K$, in particular $g\left(y_{k}\right) \in$ $\in \operatorname{Hom}(\boldsymbol{H}, \boldsymbol{G})$ for all $k=1, \ldots, n_{i}$, Consequently, we have $\left(g\left(y_{k}\right)\left(x_{1}\right), \ldots, g\left(y_{k}\right)\right.$ $\left.\left(x_{n_{i}}\right)\right) \in C_{i}$ for all $k=1, \ldots, n_{i} .(* *)$ As $C_{i}$ has the diagonal property, $(*)$ and $(* *)$ yield $\left(g\left(y_{1}\right)\left(x_{1}\right), g\left(y_{2}\right)\left(x_{2}\right), \ldots, g\left(y_{n_{i}}\right)\left(x_{n_{i}}\right)\right) \in C_{i}$, i.e. $\left(f\left(x_{1}, y_{1}\right), \ldots, f\left(x_{n_{i}}, y_{n_{i}}\right)\right) \in C_{i}$. Thus $f \in \operatorname{Hom}(\boldsymbol{H} . \boldsymbol{K}, \boldsymbol{G})$ and the definition of the mapping $\varphi$ implies $\varphi(f)=g$.

Let us call a set with one binary relation a binary structure. Such a structure can be called reflexive or transitive iff its relation is reflexive or transitive, respectively. From Secs. 13 and 16 we immediately obtain
17. Corollary. 1. Let $\boldsymbol{G}, \boldsymbol{H}, \boldsymbol{K}$ be binary struotures and let $\boldsymbol{H}, \boldsymbol{K}$ be reflexive. Then there exists an isomorphic embedding of the binary struoture $\boldsymbol{G}^{\boldsymbol{H} \boldsymbol{K}}$ into the binary structure $\left(\boldsymbol{G}^{\boldsymbol{H}}\right)^{\boldsymbol{K}}$.
2. Let $\boldsymbol{G}, \boldsymbol{H}, \boldsymbol{K}$ be binary structures. Let $\boldsymbol{H}, \boldsymbol{K}$ be reflexive and let $\boldsymbol{G}$ be transitive. Then $\left(\boldsymbol{G}^{\boldsymbol{H}}\right)^{\boldsymbol{K}} \simeq \boldsymbol{G}^{\boldsymbol{H} \cdot \boldsymbol{K}}$.
3. Let $\boldsymbol{G}, \boldsymbol{H}, \boldsymbol{K}$ be quasiordered sets. Then $\left(\boldsymbol{G}^{\boldsymbol{H}}\right)^{\boldsymbol{K}} \simeq \boldsymbol{G}^{\boldsymbol{H} \cdot \boldsymbol{K}}$.
