# Differentiability for minimizers of anisotropic integrals 

P. Cavaliere, A. D'Ottavio, F. Leonetti, M. Longobardi

#### Abstract

We consider a function $u: \Omega \rightarrow \mathbb{R}^{N}, \Omega \subset \mathbb{R}^{n}$, minimizing the integral $\int_{\Omega}\left(\left|D_{1} u\right|^{2}+\cdots+\left|D_{n-1} u\right|^{2}+\left|D_{n} u\right|^{p}\right) d x, 2(n+1) /(n+3) \leq p<2$, where $D_{i} u=\partial u / \partial x_{i}$, or some more general functional with the same behaviour; we prove the existence of second weak derivatives $D\left(D_{1} u\right), \ldots, D\left(D_{n-1} u\right) \in L^{2}$ and $D\left(D_{n} u\right) \in L^{p}$.

Keywords: regularity, minimizers, integral functionals, anisotropic growth
Classification: 49N60, 35J60

## 0. Introduction

We consider the integral functional

$$
\begin{equation*}
I(u)=\int_{\Omega} F(D u(x)) d x \tag{0.1}
\end{equation*}
$$

where $\Omega$ is bounded open subset of $\mathbb{R}^{n}, n \geq 2$, and $u: \Omega \rightarrow \mathbb{R}^{N}, N \geq 1$. $F$ satisfies the following growth condition

$$
a \sum_{i=1}^{n}\left|\xi_{i}\right|^{q_{i}}-b \leq F(\xi) \leq c \sum_{i=1}^{n}\left|\xi_{i}\right|^{q_{i}}+d, \quad \forall \xi \in \mathbb{R}^{n N}
$$

with $a, b, c, d$ positive constants and $1<q_{i}, i=1, \ldots, n$. The isotropic case, i.e. $q_{i}=q \forall i$, has been deeply studied, see, for example, [G]. In this paper we study the anisotropic case, in which at least one of the $q_{i}$ 's differs from the others. We recall that in the anisotropic case, minimizers of (0.1) may be singular when no restriction is assumed on the $q_{i}$ 's ([G1], [M]). On the other hand, if the $q_{i}$ 's are close enough, there are regularity results, among them, [M1], [FS], [FS1] deal with scalar minimizers $u: \Omega \rightarrow \mathbb{R}$ of (0.1) and [L], [BL], [BL1], [D] consider (possibly) vector valued minimizers $u: \Omega \rightarrow \mathbb{R}^{N}$. In the present paper we improve on the differentiability result for minimizers of (0.1) contained in [BL1]. As there, the prototype for (0.1) is

$$
\begin{equation*}
I(u)=\int_{\Omega}\left(\frac{1}{2} \sum_{i=1}^{n-1}\left|D_{i} u\right|^{2}+\frac{1}{p}\left|D_{n} u\right|^{p}\right) d x \tag{0.2}
\end{equation*}
$$

where $u: \Omega \subset \mathbb{R}^{n} \rightarrow \mathbb{R}^{N}, D u=\left(D_{1} u, \ldots, D_{n} u\right), D_{i} u=\partial u / \partial x_{i}, 1<p<2$.

## 1. Notation and main results

Let $\Omega$ be a bounded open set of $\mathbb{R}^{n}, n \geq 2, u$ be a (possibly) vector-valued function, $u: \Omega \rightarrow \mathbb{R}^{N}, N \geq 1$; we consider integrals

$$
\begin{equation*}
I(u)=\int_{\Omega} F(D u(x)) d x \tag{1.1}
\end{equation*}
$$

where $F: \mathbb{R}^{n N} \rightarrow \mathbb{R}$ is in $C^{1}\left(\mathbb{R}^{n N}\right)$ and satisfies, for some positive constants $c$ and $m$,

$$
\begin{gather*}
|F(\xi)| \leq c\left(1+\sum_{i=1}^{n-1}\left|\xi_{i}\right|^{2}+\left|\xi_{n}\right|^{p}\right)  \tag{1.2}\\
\left|\frac{\partial F}{\partial \xi_{i}^{\alpha}}(\xi)\right| \leq c\left(1+\left|\xi_{i}\right|\right) \quad \text { if } i=1, \ldots, n-1  \tag{1.3}\\
\left|\frac{\partial F}{\partial \xi_{n}^{\alpha}}(\xi)\right| \leq c\left(1+\left|\xi_{n}\right|^{p-1}\right) \tag{1.4}
\end{gather*}
$$

and

$$
\begin{align*}
& \sum_{j=1}^{n} \sum_{\beta=1}^{N}\left(\frac{\partial F}{\partial \xi_{j}^{\beta}}(\nu)-\frac{\partial F}{\partial \xi_{j}^{\beta}}(\lambda)\right)\left(\nu_{j}^{\beta}-\lambda_{j}^{\beta}\right)  \tag{1.5}\\
& \quad \geq m \sum_{j=1}^{n-1}\left|\nu_{j}-\lambda_{j}\right|^{2}+m\left(1+\left|\nu_{n}\right|^{2}+\left|\lambda_{n}\right|^{2}\right)^{(p-2) / 2}\left|\nu_{n}-\lambda_{n}\right|^{2}
\end{align*}
$$

for every $\lambda, \nu, \xi \in \mathbb{R}^{n N}, \alpha=1, \ldots, N$. Here, $\lambda=\left\{\lambda_{i}^{\alpha}\right\}, \xi=\left\{\xi_{i}^{\alpha}\right\},\left|\lambda_{i}\right|^{2}=$ $\sum_{\alpha=1}^{N}\left|\lambda_{i}^{\alpha}\right|^{2}$. About $p$, we assume that

$$
\begin{equation*}
1<p<2 \tag{1.6}
\end{equation*}
$$

We point out that (0.2) verifies (1.2)-(1.5). We say that $u$ minimizes the integral (1.1) if $u: \Omega \rightarrow \mathbb{R}^{N}, u \in W^{1, p}(\Omega)$ with $D_{i} u \in L^{2}(\Omega)$ for $i=1, \ldots, n-1$, and

$$
I(u) \leq I(u+\phi)
$$

for every $\phi: \Omega \rightarrow \mathbb{R}^{N}$ with $\phi \in W_{0}^{1, p}(\Omega)$ and $D_{i} \phi \in L^{2}(\Omega)$ for $i=1, \ldots, n-1$.
We first prove the following differentiability result for $D u$ :
Theorem 1. Let $u: \Omega \rightarrow \mathbb{R}^{N}$ satisfy $u \in W^{1, p}(\Omega)$ with $D_{i} u \in L^{2}(\Omega)$ for $i=1, \ldots, n-1$. If $F$ satisfies (1.2)-(1.5), (1.6) and $u$ minimizes the integral (1.1), then for $s=1, \ldots, n-1$

$$
\begin{gather*}
D_{s}\left(D_{i} u\right) \in L_{\mathrm{loc}}^{2}(\Omega), \quad \forall i=1, \ldots, n-1  \tag{1.7}\\
D_{s}\left(D_{n} u\right) \in L_{\mathrm{loc}}^{p}(\Omega)  \tag{1.8}\\
D_{s}\left(\left(1+\left|D_{n} u\right|^{2}\right)^{(p-2) / 4} D_{n} u\right) \in L_{\mathrm{loc}}^{2}(\Omega) \tag{1.9}
\end{gather*}
$$

This differentiability result allows us to improve on the integrability of first $n-1$ components $D_{1} u, \ldots, D_{n-1} u$ of the gradient:

Corollary 1. Under the assumptions of Theorem 1 we have

$$
D_{s} u \in L_{\mathrm{loc}}^{\bar{p}^{*}}(\Omega), \quad s=1, \ldots, n-1
$$

where

$$
\bar{p}^{*}=\frac{2 p n}{p(n-3)+2}>2 .
$$

So, by the improved integrability, we can get the existence of second weak derivatives with respect to $x_{n}$ :
Theorem 2. Under the assumptions of Theorem 1, if $p$ verifies the additional restriction

$$
\begin{equation*}
2 \frac{n+1}{n+3} \leq p<2 \tag{1.10}
\end{equation*}
$$

then

$$
\begin{gathered}
D_{n}\left(D_{i} u\right) \in L_{\mathrm{loc}}^{2}(\Omega), \quad \forall i=1, \ldots, n-1, \\
D_{n}\left(D_{n} u\right) \in L_{\mathrm{loc}}^{p}(\Omega), \\
D_{n}\left(\left(1+\left|D_{n} u\right|^{2}\right)^{(p-2) / 4} D_{n} u\right) \in L_{\mathrm{loc}}^{2}(\Omega)
\end{gathered}
$$

Using Sobolev imbedding theorem we get Hölder continuity for $u$ in dimension 2 and 3 :

Corollary 2. Under the assumptions of Theorem 2, we have

$$
\begin{array}{ll}
u \in C_{\mathrm{loc}}^{0, \beta}(\Omega), \quad \forall \beta<1, \quad \text { when } n=2 \\
u \in C_{\mathrm{loc}}^{0,1-1 / p}(\Omega), \quad \text { when } n=3
\end{array}
$$

Remark. The higher differentiability contained in Theorem 1 and 2 was proved in [BL1] under the stronger assumption $2-2 /(n+1)<p<2$.

## 2. Known results

For a vector-valued function $f(x)$, define the difference

$$
\tau_{s, h} f(x)=f\left(x+h e_{s}\right)-f(x),
$$

where $h \in \mathbb{R}, e_{s}$ is the unit vector in the $x_{s}$ direction, and $s=1,2, \ldots, n$. For $x_{0} \in \mathbb{R}^{n}$, let $B_{R}=B_{R}\left(x_{0}\right)$ be the ball centered at $x_{0}$ with radius $R$. We now state several lemmas that we need later. In the following $f: \Omega \rightarrow \mathbb{R}^{k}, k \geq 1 ; B_{\rho}$, $B_{R}, B_{2 \rho}$ and $B_{2 R}$ are concentric balls.

Lemma 1. If $0<\rho<R,|h|<R-\rho, 1 \leq t<\infty, s \in\{1, \ldots, n\}, f, D_{s} f \in$ $L^{t}\left(B_{R}\right)$, then

$$
\int_{B_{\rho}}\left|\tau_{s, h} f(x)\right|^{t} d x \leq|h|^{t} \int_{B_{R}}\left|D_{s} f(x)\right|^{t} d x .
$$

(See [G, p. 45], [C, p. 28].)
Lemma 2. Let $f \in L^{t}\left(B_{2 \rho}\right), 1<t<\infty, s \in\{1, \ldots, n\}$; if there exists a positive constant $C$ such that

$$
\int_{B_{\rho}}\left|\tau_{s, h} f(x)\right|^{t} d x \leq C|h|^{t}
$$

for every $h$ with $|h|<\rho$, then there exists $D_{s} f \in L^{t}\left(B_{\rho}\right)$. (See [G, p. 45], [C, p. 26].)

Lemma 3. For every $\gamma \in(-1 / 2,0)$ we have

$$
(2 \gamma+1)|a-b| \leq \frac{\left|\left(1+|a|^{2}\right)^{\gamma} a-\left(1+|b|^{2}\right)^{\gamma} b\right|}{\left(1+|a|^{2}+|b|^{2}\right)^{\gamma}} \leq \frac{c(k)}{2 \gamma+1}|a-b|,
$$

for all $a, b \in \mathbb{R}^{k}$. (See [AF].)
Lemma 4. Let $Q$ be an open cube of $\mathbb{R}^{n}, f \in W^{1,1}(Q)$, with $D_{i} f \in L^{p_{i}}(Q)$, $p_{i} \geq 1, i=1, \ldots, n$ and

$$
\frac{1}{\bar{p}}=\frac{1}{n} \sum_{i=1}^{n} \frac{1}{p_{i}}
$$

If $\bar{p}<n$ and $p_{i}<\bar{p}^{*}=\bar{p} n /(n-\bar{p}) \forall i=1, \ldots, n$, then $f \in L^{\bar{p}^{*}}(Q)$. (See [T], [AF1].)

## 3. Proof of Theorem 1

Since $u$ minimizes the integral (1.1) with growth conditions as in (1.2)-(1.4), $u$ solves the Euler equation

$$
\begin{equation*}
\int_{\Omega} \sum_{i=1}^{n} \sum_{\alpha=1}^{N} \frac{\partial F}{\partial \xi_{i}^{\alpha}}(D u(x)) D_{i} \phi^{\alpha}(x) d x=0 \tag{3.1}
\end{equation*}
$$

for all functions $\phi: \Omega \rightarrow \mathbb{R}^{N}$, with $\phi \in W_{0}^{1, p}(\Omega)$ and $D_{1} \phi, \ldots, D_{n-1} \phi \in L^{2}(\Omega)$. Let $R>0$ be such that $\overline{B_{4 R}} \subset \Omega$ and let $B_{\rho}$ and $B_{R}$ be concentric balls with $0<\rho<R \leq 1$. Fix $s$, take $0<|h|<R$ and let $\eta: \mathbb{R}^{n} \rightarrow \mathbb{R}$ be a "cut off" function
in $C_{0}^{2}\left(B_{R}\right)$ with $0 \leq \eta \leq 1$ in $\mathbb{R}^{n}$ and $\eta \equiv 1$ on $B_{\rho}$. Using $\phi=\tau_{s,-h}\left(\eta^{2} \tau_{s, h} u\right)$ in (3.1) we get, as usual,

$$
\begin{aligned}
0=\sum_{i=1}^{n} \sum_{\alpha=1}^{N} \int & \frac{\partial F}{\partial \xi_{i}^{\alpha}}(D u) \tau_{s,-h}\left(D_{i}\left(\eta^{2} \tau_{s, h} u^{\alpha}\right)\right) d x \\
& =\sum_{i=1}^{n} \sum_{\alpha=1}^{N} \int \tau_{s, h}\left(\frac{\partial F}{\partial \xi_{i}^{\alpha}}(D u)\right)\left(2 \eta D_{i} \eta \tau_{s, h} u^{\alpha}+\eta^{2} \tau_{s, h} D_{i} u^{\alpha}\right) d x
\end{aligned}
$$

so that

$$
\begin{align*}
&(I)=\int_{B_{R}} \sum_{i=1}^{n} \sum_{\alpha=1}^{N} \tau_{s, h}\left(\frac{\partial F}{\partial \xi_{i}^{\alpha}}(D u)\right) \tau_{s, h} D_{i} u^{\alpha} \eta^{2} d x  \tag{3.2}\\
&=-\int_{B_{R}} \sum_{i=1}^{n} \sum_{\alpha=1}^{N} \tau_{s, h}\left(\frac{\partial F}{\partial \xi_{i}^{\alpha}}(D u)\right) 2 \eta D_{i} \eta \tau_{s, h} u^{\alpha} d x=(I I)
\end{align*}
$$

We apply (1.5) so that

$$
\begin{aligned}
& m \int_{B_{R}} \sum_{i=1}^{n-1}\left|\tau_{s, h} D_{i} u(x)\right|^{2} \eta^{2}(x) d x \\
& +m \int_{B_{R}}\left(1+\left|D_{n} u(x)\right|^{2}+\left|D_{n} u\left(x+h e_{s}\right)\right|^{2}\right)^{(p-2) / 2}\left|\tau_{s, h} D_{n} u(x)\right|^{2} \eta^{2}(x) d x \leq(I)
\end{aligned}
$$

Set

$$
\begin{equation*}
V\left(\xi_{n}\right)=\left(1+\left|\xi_{n}\right|^{2}\right)^{(p-2) / 4} \xi_{n}, \quad \forall \xi \in \mathbb{R}^{n N} \tag{3.3}
\end{equation*}
$$

Using Lemma 3 we find

$$
\begin{align*}
& C_{2}\left|\tau_{s, h} D_{n} u(x)\right| \leq \frac{\left|\tau_{s, h} V\left(D_{n} u(x)\right)\right|}{\left(1+\left|D_{n} u(x)\right|^{2}+\left|D_{n} u\left(x+h e_{s}\right)\right|^{2}\right)^{(p-2) / 4}}  \tag{3.4}\\
& \leq C_{3}\left|\tau_{s, h} D_{n} u(x)\right|
\end{align*}
$$

for some positive constants $C_{2}, C_{3}$ depending only on $N$ and $p$. Then

$$
\begin{equation*}
m \int_{B_{R}}\left|\tau_{s, h} V\left(D_{n} u\right)\right|^{2} \eta^{2} d x+m \int_{B_{R}} \sum_{i=1}^{n-1}\left|\tau_{s, h} D_{i} u\right|^{2} \eta^{2} d x \leq C_{4}(I) \tag{3.5}
\end{equation*}
$$

for some positive constant $C_{4}$, depending only on $N$ and $p$. We use the left-hand side of (3.4), Hölder's inequality with $2 /(2-p)$ and $2 / p$ in order to get

$$
\begin{aligned}
& \int_{B_{R}}\left|\tau_{s, h} D_{n} u(x)\right|^{p} \eta^{p}(x) d x \\
& \leq C_{2}^{-p} \int_{B_{R}}\left(1+\left|D_{n} u(x)\right|^{2}+\left|D_{n} u\left(x+h e_{s}\right)\right|^{2}\right)^{p(2-p) / 4}\left|\tau_{s, h} V\left(D_{n} u(x)\right)\right|^{p} \eta^{p}(x) d x \\
& \quad \leq C_{2}^{-p}\left(\int_{B_{R}}\left(1+\left|D_{n} u(x)\right|^{2}+\left|D_{n} u\left(x+h e_{s}\right)\right|^{2}\right)^{p / 2} d x\right)^{(2-p) / 2} \times \\
& \\
& \quad \times\left(\int_{B_{R}}\left|\tau_{s, h} V\left(D_{n} u(x)\right)\right|^{2} \eta^{2}(x) d x\right)^{p / 2}
\end{aligned}
$$

Now, splitting the integral and changing variables yield

$$
\begin{aligned}
& C_{2}^{-p}\left(\int_{B_{R}}\left(1+\left|D_{n} u(x)\right|^{2}+\left|D_{n} u\left(x+h e_{s}\right)\right|^{2}\right)^{p / 2} d x\right)^{(2-p) / 2} \\
& \leq C_{5}\left(\int_{B_{2 R}}\left(1+\left|D_{n} u(y)\right|^{p}\right) d y\right)^{(2-p) / 2}=C_{6}
\end{aligned}
$$

for some positive constants $C_{5}$ and $C_{6}$, independent of $h$, so that

$$
\begin{equation*}
C_{6}^{-2 / p}\left(\int_{B_{R}}\left|\tau_{s, h} D_{n} u\right|^{p} \eta^{p} d x\right)^{2 / p} \leq \int_{B_{R}}\left|\tau_{s, h} V\left(D_{n} u\right)\right|^{2} \eta^{2} d x \tag{3.6}
\end{equation*}
$$

then, using (3.6), (3.5) and (3.2) we arrive at

$$
\begin{array}{r}
\frac{m}{2} C_{6}^{-2 / p}\left(\int_{B_{R}}\left|\tau_{s, h} D_{n} u\right|^{p} \eta^{p} d x\right)^{2 / p}+\frac{m}{2} \int_{B_{R}}\left|\tau_{s, h} V\left(D_{n} u\right)\right|^{2} \eta^{2} d x  \tag{3.7}\\
+m \int_{B_{R}} \sum_{i=1}^{n-1}\left|\tau_{s, h} D_{i} u\right|^{2} \eta^{2} d x \leq C_{4}(I)=C_{4}(I I)
\end{array}
$$

We recall that, from (3.2)

$$
(I I)=-\int \sum_{i=1}^{n} \sum_{\alpha=1}^{N} \tau_{s, h}\left(\frac{\partial F}{\partial \xi_{i}^{\alpha}}(D u)\right) 2 \eta D_{i} \eta \tau_{s, h} u^{\alpha} d x
$$

now we shift the difference operator $\tau_{s, h}$ from $\left(\partial F / \partial \xi_{i}^{\alpha}\right)(D u)$ to $2 \eta D_{i} \eta \tau_{s, h} u^{\alpha}$ ([N]):

$$
\begin{align*}
(I I)=-\int \sum_{i=1}^{n} \sum_{\alpha=1}^{N} \tau_{s, h} & \left(\frac{\partial F}{\partial \xi_{i}^{\alpha}}(D u)\right) 2 \eta D_{i} \eta \tau_{s, h} u^{\alpha} d x  \tag{3.8}\\
& =-\int \sum_{i=1}^{n} \sum_{\alpha=1}^{N} \frac{\partial F}{\partial \xi_{i}^{\alpha}}(D u) \tau_{s,-h}\left(2 \eta D_{i} \eta \tau_{s, h} u^{\alpha}\right) d x
\end{align*}
$$

We use the growth conditions (1.3), (1.4) and Cauchy-Schwartz's inequality in (3.8) in order to get

$$
\begin{align*}
C_{4}(I I) \leq C_{7}\left(\int _ { B _ { 2 R } } \left(1+\sum_{i=1}^{n-1}\left|D_{i} u\right|^{2}\right.\right. & \left.\left.+\left|D_{n} u\right|^{2 p-2}\right) d x\right)^{1 / 2} \times  \tag{3.9}\\
& \times\left(\int_{B_{2 R}}\left|\tau_{s,-h}\left(2 \eta D \eta \tau_{s, h} u\right)\right|^{2} d x\right)^{1 / 2}
\end{align*}
$$

for some positive constant $C_{7}$ independent of $h$. Since $0<2 p-2<p$,

$$
\begin{equation*}
\left(\int_{B_{2 R}}\left(1+\sum_{i=1}^{n-1}\left|D_{i} u\right|^{2}+\left|D_{n} u\right|^{2 p-2}\right) d x\right)^{1 / 2}=C_{8}<\infty \tag{3.10}
\end{equation*}
$$

Now we apply Lemma 1 :

$$
\begin{align*}
& \text { 11) }\left(\int_{B_{2 R}}\left|\tau_{s,-h}\left(2 \eta D \eta \tau_{s, h} u\right)\right|^{2} d x\right)^{1 / 2}  \tag{3.11}\\
& \leq|h|\left(\int_{B_{3 R}}\left|D_{s}\left(2 \eta D \eta \tau_{s, h} u\right)\right|^{2} d x\right)^{1 / 2}=|h|\left(\int_{B_{R}}\left|D_{s}\left(2 \eta D \eta \tau_{s, h} u\right)\right|^{2} d x\right)^{1 / 2}
\end{align*}
$$

since $\eta=0$ outside $B_{R}$. Taking into account (3.7), (3.9), (3.10) and (3.11), we arrive at

$$
\begin{array}{r}
\left(\int_{B_{R}}\left|\tau_{s, h} D_{n} u\right|^{p} \eta^{p} d x\right)^{2 / p}+\int_{B_{R}}\left|\tau_{s, h} V\left(D_{n} u\right)\right|^{2} \eta^{2} d x+\int_{B_{R}} \sum_{i=1}^{n-1}\left|\tau_{s, h} D_{i} u\right|^{2} \eta^{2} d x  \tag{3.12}\\
\leq C_{9}|h|\left(\int_{B_{R}}\left|D_{s}\left(2 \eta D \eta \tau_{s, h} u\right)\right|^{2} d x\right)^{1 / 2}=(I I I)
\end{array}
$$

for some positive constant $C_{9}$, independent of $h$. Now, using the Young's inequality, for every $\epsilon>0$ we have

$$
\begin{equation*}
(I I I) \leq \frac{C_{9}^{2}|h|^{2}}{\epsilon}+\epsilon \int_{B_{R}}\left|D_{s}\left(2 \eta D \eta \tau_{s, h} u\right)\right|^{2} d x \tag{3.13}
\end{equation*}
$$

The integral in the previous inequality is dealt with as follows:

$$
\begin{align*}
\int_{B_{R}}\left|D_{s}\left(2 \eta D \eta \tau_{s, h} u\right)\right|^{2} d x \leq 2 \int_{B_{R}} & \left|D_{s}(2 \eta D \eta) \tau_{s, h} u\right|^{2} d x  \tag{3.14}\\
& +2 \int_{B_{R}}\left|2 \eta D \eta \tau_{s, h} D_{s} u\right|^{2} d x=(A)+(B)
\end{align*}
$$

Now Lemma 4 allows us to use Lemma 1 to get for some positive constants $C_{10}$ and $C_{11}$, independent of $h$,

$$
\begin{equation*}
(A) \leq C_{10}|h|^{2} \int_{B_{2 R}}\left|D_{s} u\right|^{2} d x=C_{11}|h|^{2} \tag{3.15}
\end{equation*}
$$

which holds true just for $s=1, \ldots, n-1$, since $D_{1} u, \ldots, D_{n-1} u \in L^{2}$ but $D_{n} u \in$ $L^{p}, p<2$. On the other hand, we have, for $s=1, \ldots, n-1$,

$$
\begin{equation*}
(B) \leq C_{12} \int_{B_{R}}\left|\tau_{s, h} D_{s} u\right|^{2} \eta^{2} d x \leq C_{12} \sum_{i=1}^{n-1} \int_{B_{R}}\left|\tau_{s, h} D_{i} u\right|^{2} \eta^{2} d x \tag{3.16}
\end{equation*}
$$

for a positive constant $C_{12}$, independent of $h$. We insert (3.15) and (3.16) into (3.14), use the resulting inequality in (3.13) and keep in mind (3.12). Then

$$
\begin{aligned}
\left(\int_{B_{R}}\left|\tau_{s, h} D_{n} u\right|^{p} \eta^{p} d x\right)^{2 / p} & +\int_{B_{R}}\left|\tau_{s, h} V\left(D_{n} u\right)\right|^{2} \eta^{2} d x+\int_{B_{R}}^{n-1} \sum_{i=1}^{n-1}\left|\tau_{s, h} D_{i} u\right|^{2} \eta^{2} d x \\
& \leq \frac{C_{13}|h|^{2}}{\epsilon}+\epsilon C_{13}\left(|h|^{2}+\int_{B_{R}} \sum_{i=1}^{n-1}\left|\tau_{s, h} D_{i} u\right|^{2} \eta^{2} d x\right)
\end{aligned}
$$

for some positive constant $C_{13}$, independent of $h$ and $\epsilon$, so taking $\epsilon=1 /\left(2 C_{13}\right)$, we finally get

$$
\begin{gathered}
\int_{B_{R}}\left|\tau_{s, h} V\left(D_{n} u\right)\right|^{2} \eta^{2} d x+\int_{B_{R}} \sum_{i=1}^{n-1}\left|\tau_{s, h} D_{i} u\right|^{2} \eta^{2} d x \leq C_{14}|h|^{2} \\
\int_{B_{R}}\left|\tau_{s, h} D_{n} u\right|^{p} \eta^{p} d x \leq C_{14}^{p / 2}|h|^{p}
\end{gathered}
$$

for some positive constant $C_{14}$, independent of $h$. Since $\eta=1$ on $B_{\rho} \subset B_{R}$, we can apply Lemma 2 and, after recalling (3.3) for the definition of $V\left(D_{n} u\right)$, we get (1.7), (1.8), (1.9), so we end the proof.

## 4. Proof of Corollary 1

Since we can change the order for distributional derivatives, so $D_{i} D_{s} u=$ $D_{s} D_{i} u$, using the result of Theorem 1 we get

$$
\begin{gathered}
D_{i} D_{s} u \in L_{\mathrm{loc}}^{2}(\Omega), \quad i=1, \ldots, n-1, \\
D_{n} D_{s} u \in L_{\mathrm{loc}}^{p}(\Omega)
\end{gathered}
$$

for every $s \in\{1, \ldots, n-1\}$. Applying Lemma 4 with $p_{1}=\cdots=p_{n-1}=2, p_{n}=p$ we obtain $\bar{p}=(2 p n) /[p(n-1)+2]<n$ thus $\bar{p}^{*}=(2 p n) /[p(n-3)+2]$ and

$$
D_{s} u \in L_{\mathrm{loc}}^{\bar{p}^{*}}(\Omega) \quad \forall s=1, \ldots, n-1
$$

This ends the proof.

## 5. Proof of Theorem 2

Corollary 1 guarantees that

$$
D_{1} u, \ldots, D_{n-1} u \in L_{\mathrm{loc}}^{\bar{p} *}(\Omega)
$$

Moreover the additional restriction (1.10) implies that $\bar{p}^{*} \geq p /(p-1)$, thus

$$
\begin{equation*}
D_{1} u, \ldots, D_{n-1} u \in L_{\mathrm{loc}}^{p /(p-1)}(\Omega) \tag{5.1}
\end{equation*}
$$

Now we proceed as in the proof of Theorem 1 until (3.8). Then, using the growth conditions (1.3), (1.4) and the Hölder's inequality with $p /(p-1)$ and $p$, we get

$$
\begin{aligned}
& C_{4}(I I) \leq C_{15}\left(\int_{B_{2 R}}\left(1+\sum_{i=1}^{n-1}\left|D_{i} u\right|^{p /(p-1)}+\left|D_{n} u\right|^{p}\right) d x\right)^{(p-1) / p} \times \\
& \times\left(\int_{B_{2 R}}\left|\tau_{s,-h}\left(2 \eta D \eta \tau_{s, h} u\right)\right|^{p} d x\right)^{1 / p}
\end{aligned}
$$

for some positive constant $C_{15}$ independent of $h$. The previous inequality is exactly (5.5) in [BL1] and from now the proof goes on as there. For the convenience of reader we quote the main steps. We use the higher integrability result stated in (5.1):

$$
\left(\int_{B_{2 R}}\left(1+\sum_{i=1}^{n-1}\left|D_{i} u\right|^{p /(p-1)}+\left|D_{n} u\right|^{p}\right) d x\right)^{(p-1) / p}=C_{16}<\infty
$$

Applying Lemma 1 with $t=p$

$$
\begin{aligned}
& \left(\int_{B_{2 R}}\left|\tau_{s,-h}\left(2 \eta D \eta \tau_{s, h} u\right)\right|^{p} d x\right)^{1 / p} \leq|h|\left(\int_{B_{3 R}}\left|D_{s}\left(2 \eta D \eta \tau_{s, h} u\right)\right|^{p} d x\right)^{1 / p} \\
& \quad \leq|h|\left(\int_{B_{R}}\left|D_{s}(2 \eta D \eta) \tau_{s, h} u\right|^{p} d x\right)^{1 / p}+|h|\left(\int_{B_{R}}\left|2 \eta D \eta \tau_{s, h} D_{s} u\right|^{p} d x\right)^{1 / p} \\
& =|h|\{(A)+(B)\}
\end{aligned}
$$

Using again Lemma 1, we get

$$
(A) \leq C_{17}\left(\int_{B_{2 R}}\left|D_{s} u\right|^{p} d x\right)^{1 / p}|h|=C_{18}|h|
$$

for some positive constants $C_{17}$ and $C_{18}$, independent of $h$. On the other hand, using Hölder's inequality, we have

$$
\begin{aligned}
(B) & \leq C_{19}\left(\int_{B_{R}}\left|\tau_{s, h} D_{s} u\right|^{p} \eta^{p} d x\right)^{1 / p} \leq C_{19}\left(\sum_{i=1}^{n} \int_{B_{R}}\left|\tau_{s, h} D_{i} u\right|^{p} \eta^{p} d x\right)^{1 / p} \\
& \leq C_{20}\left(\sum_{i=1}^{n-1} \int_{B_{R}}\left|\tau_{s, h} D_{i} u\right|^{p} \eta^{p} d x\right)^{1 / p}+C_{20}\left(\int_{B_{R}}\left|\tau_{s, h} D_{n} u\right|^{p} \eta^{p} d x\right)^{1 / p} \\
& \leq C_{21}\left(\sum_{i=1}^{n-1} \int_{B_{R}}\left|\tau_{s, h} D_{i} u\right|^{2} \eta^{2} d x\right)^{1 / 2}+C_{20}\left(\int_{B_{R}}\left|\tau_{s, h} D_{n} u\right|^{p} \eta^{p} d x\right)^{1 / p}
\end{aligned}
$$

for some positive constants $C_{19}, C_{20}$ and $C_{21}$, independent of $h$. Eventually, we get

$$
\begin{aligned}
& \left(\int_{B_{R}}\left|\tau_{s, h} D_{n} u\right|^{p} \eta^{p} d x\right)^{2 / p}+\int_{B_{R}}\left|\tau_{s, h} V\left(D_{n} u\right)\right|^{2} \eta^{2} d x+\int_{B_{R}} \sum_{i=1}^{n-1}\left|\tau_{s, h} D_{i} u\right|^{2} \eta^{2} d x \\
& \leq \frac{C_{22}|h|^{2}}{\epsilon}+\epsilon C_{22}\left(|h|^{2}+\int_{B_{R}} \sum_{i=1}^{n-1}\left|\tau_{s, h} D_{i} u\right|^{2} \eta^{2} d x+\left(\int_{B_{R}}\left|\tau_{s, h} D_{n} u\right|^{p} \eta^{p} d x\right)^{2 / p}\right)
\end{aligned}
$$

for some positive constant $C_{22}$, independent of $h$ and $\epsilon$, so taking $\epsilon=1 /\left(2 C_{22}\right)$, we finally have

$$
\begin{gathered}
\int_{B_{R}}\left|\tau_{s, h} V\left(D_{n} u\right)\right|^{2} \eta^{2} d x+\int_{B_{R}} \sum_{i=1}^{n-1}\left|\tau_{s, h} D_{i} u\right|^{2} \eta^{2} d x \leq C_{23}|h|^{2} \\
\int_{B_{R}}\left|\tau_{s, h} D_{n} u\right|^{p} \eta^{p} d x \leq C_{23}^{p / 2}|h|^{p}
\end{gathered}
$$

for some positive constant $C_{23}$, independent of $h$, where $s$ may also assume the value $n$. Application of Lemma 2 ends the proof.
