# Club-guessing, good points and diamond 

Pierre Matet

#### Abstract

Shelah's club-guessing and good points are used to show that the two-cardinal diamond principle $\diamond_{\kappa, \lambda}$ holds for various values of $\kappa$ and $\lambda$.

Keywords: $P_{\kappa}(\lambda)$, diamond principle
Classification: 03E05

Let $\kappa$ be a regular cardinal greater than or equal to $\omega_{2}$, and $\lambda$ be a cardinal greater than $\kappa$. In [4] Jech introduced the following notions. $P_{\kappa}(\lambda)$ denotes the collection of all subsets of $\lambda$ of size less than $\kappa$. A subset $C$ of $P_{\kappa}(\lambda)$ is closed unbounded if (a) it is cofinal in the partially ordered set $\left(P_{\kappa}(\lambda), \subset\right)$, and (b) for any infinite ordinal $\theta<\kappa$ and any sequence $\left\langle a_{\alpha}: \alpha<\theta\right\rangle$ of elements of $C$ such that $a_{\beta} \subset a_{\alpha}$ whenever $\beta<\alpha<\theta, \bigcup_{\alpha<\theta} a_{\alpha} \in C$. A subset $S$ of $P_{\kappa}(\lambda)$ is stationary if $S \cap C \neq \emptyset$ for every closed unbounded subset $C$ of $P_{\kappa}(\lambda)$. The principle $\diamond_{\kappa, \lambda}$ asserts the existence of a sequence $\left\langle s_{a}: a \in P_{\kappa}(\lambda)\right\rangle$ with $s_{a} \subseteq a$ such that for any $X \subseteq \lambda,\left\{a: s_{a}=X \cap a\right\}$ is a stationary subset of $P_{\kappa}(\lambda)$. Jech showed that $\nabla_{\kappa, \lambda}$ could be introduced by forcing. Moreover, he proved that $\diamond_{\kappa, \lambda}$ holds in the constructible universe $L$. It was shown in [2] that if $2^{<\kappa}<\lambda$, then $\diamond_{\kappa, \lambda}$ holds. In this paper we show that if $2^{<\kappa} \leq \mu^{+}$for some cardinal $\mu$ such that $\omega<\operatorname{cf}(\mu)<\kappa<\mu \leq \lambda$, then $\diamond_{\kappa, \lambda}$ holds. So if either $2^{<\kappa}=\lambda$ and $\lambda$ is the successor of a cardinal of uncountable cofinality less than $\kappa$, or $2^{<\kappa}=\lambda^{+}$ and $\omega<\operatorname{cf}(\lambda)<\kappa$, then $\diamond_{\kappa, \lambda}$ holds (and hence the nonstationary ideal on $P_{\kappa}(\lambda)$ is not $2^{\lambda}$-saturated). Our result is proved by modifying the argument used by Foreman and Magidor in [3] to show that if $\operatorname{cf}(\lambda)<\kappa$, then there is a family of $\lambda^{++}$stationary subsets of $P_{\kappa}(\lambda)$ such that any two of them have nonstationary intersection.

We need a few lemmas.
Lemma 1 (Solovay [9]). Let $\rho$ be a regular uncountable cardinal. Then every stationary subset of $\rho$ is the union of $\rho$ disjoint stationary sets.

Given two regular infinite cardinals $\theta<\rho, E_{\theta}^{\rho}$ denotes the set of all infinite limit ordinals $\alpha<\rho$ such that $\operatorname{cf}(\alpha)=\theta$.

Lemma 2 (Shelah see [5]). Let $\rho>\omega_{1}$ be a regular cardinal, and $S$ be a stationary subset of $E_{\omega}^{\rho}$. Then one can find a cofinal, order-type $\omega$ subset $c_{\gamma}$ of $\gamma$ for each $\gamma \in S$ so that $\left\{\gamma \in S: c_{\gamma} \subseteq C\right\}$ is stationary in $\rho$ for any closed unbounded subset $C$ of $\rho$.

Our source for the following notions and facts is [1]. Let $\mu>\kappa$ be a singular cardinal of uncountable cofinality $\nu<\kappa$. Suppose $\left\langle\mu_{i}: i<\nu\right\rangle$ is an increasing sequence of regular cardinals such that $\kappa<\mu_{0}$ and $\sup \left\{\mu_{i}: i<\nu\right\}=\mu$. Given $f, g \in \prod_{i<\nu} \mu_{i}, f<^{*} g$ means that $|\{i: f(i) \geq(i)\}|<\nu$. Similarly, $f \leq^{*} g$ means that $|\{i: f(i)>g(i)\}|<\nu$. By a scale of length $\xi, \xi$ an ordinal, we mean a sequence $\left\langle f_{\alpha}: \alpha<\xi\right\rangle$ of elements of $\prod_{i<\nu} \mu_{i}$ such that (a) $f_{\beta}<^{*} f_{\alpha}$ whenever $\beta<\alpha<\xi$, and (b) for every $g \in \prod_{i<\nu} \mu_{i}$, there is $\alpha<\xi$ with $g<^{*} f_{\alpha}$. Shelah proved that the $\mu_{i}$ can be chosen so that there exists a scale of length $\mu^{+}$. Let $\left\langle f_{\alpha}: \alpha<\mu^{+}\right\rangle$be such a scale. Given an infinite limit ordinal $\alpha<\mu^{+}$, an exact upper bound for the sequence $\left\langle f_{\beta}: \beta<\alpha\right\rangle$ is an element $g$ of $\prod_{i<\nu} \mu_{i}$ such that (i) $f_{\beta}<^{*} g$ for any $\beta<\alpha$, and (ii) for every $h \in \prod_{i<\nu} \mu_{i}$ with $h<^{*} g$, there is $\beta<\alpha$ with $h<^{*} f_{\beta}$. By a good point, an infinite limit ordinal $\alpha<\mu^{+}$is meant such that $\operatorname{cf}(\alpha)>\nu$ and there exists an exact upper bound $g_{\alpha}$ for $\left\langle f_{\beta}: \beta<\alpha\right\rangle$ with the property that for any $i<\nu, g_{\alpha}(i)$ is an infinite limit ordinal of cofinality $\operatorname{cf}(\alpha)$. Letting $S$ denote the set of good points $\alpha$ such that $\operatorname{cf}(\alpha)=\kappa, S$ is stationary in $\mu^{+}$. Now consider the sequence $\left\langle h_{\alpha}: \alpha<\mu^{+}\right\rangle$defined by: $h_{\alpha}=f_{\alpha}$ if $\alpha \notin S$, and $h_{\alpha}=g_{\alpha}$ otherwise. Then $\left\langle h_{\alpha}: \alpha<\mu^{+}\right\rangle$is a scale. Moreover, for each $\alpha \in S, h_{\alpha}$ is an exact upper bound for $\left\langle h_{\beta}: \beta<\alpha\right\rangle$. Let us sum it up all in the following.

Lemma 3 (Shelah see [1]). Let $\mu>\kappa$ be a singular cardinal of uncountable cofinality $\nu<\kappa$. Then one can find sequences $\left\langle\mu_{i}: i<\nu\right\rangle$ and $\left\langle h_{\alpha}: \alpha<\mu^{+}\right\rangle$and a set $S$ such that (a) $\left\langle\mu_{i}: i<\nu\right\rangle$ is an increasing sequence of regular cardinals such that $\kappa<\mu_{0}$ and $\sup \left\{\mu_{i}: i<\nu\right\}=\mu$, (b) $\left\langle h_{\alpha}: \alpha<\mu^{+}\right\rangle$is a scale of length $\mu^{+}$in $\prod_{i<\nu} \mu_{i}$, (c) $S$ is a stationary subset of $E_{\kappa}^{\mu^{+}}$, and (d) for each $\alpha \in S$, $\operatorname{ran}\left(h_{\alpha}\right) \subseteq E_{\kappa}^{\mu^{+}}$and $h_{\alpha}$ is an exact upper bound for $\left\langle h_{\beta}: \beta<\alpha\right\rangle$.

Suppose $\mu$ is a cardinal greater than $\kappa$. For $n<\omega$, let $R_{n}^{\mu}$ be the set of all increasing functions from $n$ to $E_{\kappa}^{\mu^{+}}$. Let $\mathcal{T}_{\mu}$ be the collection of all nonempty subsets $T$ of $\bigcup_{n<\omega} R_{n}^{\mu}$ such that for any $n<\omega$ and any $t \in T \cap R_{n}^{\mu},\{t \upharpoonright \ell: \ell<$ $n\} \subseteq T$ and $\left\{\alpha \in E_{\kappa}^{\mu^{+}}: t \cup\{n, \alpha\} \in T\right\}$ is stationary in $\mu^{+}$.

Lemma 4 (Shioya [8]). Suppose that $\mu>\kappa$ is a cardinal, $T \in \mathcal{T}_{\mu}, n<\omega$ and $\varphi: T \cap\left(\bigcup_{n<q<\omega} R_{q}^{\mu}\right) \rightarrow \mu^{+}$is such that for every $t \in \operatorname{dom}(\varphi)$, (a) $\varphi(t) \in t(n)$, and (b) $\varphi(t \upharpoonright q) \leq \varphi(t)$ for $n<q<\operatorname{dom}(t)$. Then one can find $T^{\prime} \in \mathcal{T}_{\mu} \cap P(T)$ and $\psi: T \cap R_{n}^{\mu} \rightarrow \mu^{+}$so that (i) $T^{\prime} \cap R_{n}^{\mu}=T \cap R_{n}^{\mu}$ and (ii) $\varphi(t) \leq \psi(t \upharpoonright n)$ for any $t \in T^{\prime} \cap\left(\bigcup_{n<q<\omega} R_{q}^{\mu}\right)$.

For $A \subseteq P_{\kappa}(\lambda), G_{\kappa, \lambda}(A)$ denotes the following two-person game lasting $\omega$ moves. Player I makes the first move. I and II alternately pick members of $P_{\kappa}(\lambda)$, thus building a sequence $\left\langle a_{n}: n\langle\omega\rangle\right.$ with the condition that $a_{0} \subseteq a_{1} \subseteq \ldots$ II wins the game just in case $\bigcup_{n<\omega} a_{n} \in A$. Let $N G_{\kappa, \lambda}$ be the set of all $B \subseteq P_{\kappa}(\lambda)$ such that II has a winning strategy in $G_{\kappa, \lambda}\left(P_{\kappa}(\lambda) \backslash B\right)$.

Lemma 5 (Matet [6]). $N G_{\kappa, \lambda}$ is a normal ideal on $P_{\kappa}(\lambda)$.
Proposition 6. Suppose $2^{<\kappa} \leq \mu^{+}$for some cardinal $\mu$ such that $\kappa<\mu \leq \lambda$ and $\omega<\operatorname{cf}(\mu)<\kappa$. Then there is a sequence $\left\langle s_{a}: a \in P_{\kappa}(\lambda)\right\rangle$ with $s_{a} \subseteq a$ such that for any $X \subseteq \lambda,\left\{a: s_{a}=X \cap a\right\} \in N G_{\kappa, \lambda}^{+}$.

Proof: Let $\mu$ be a fixed cardinal such that $\omega<\operatorname{cf}(\mu)<\kappa<\mu \leq \lambda$ and $2^{<\kappa} \leq \mu^{+}$. Fix a stationary subset $H$ of $E_{\omega}^{\mu^{+}}$. Using Lemma 2, select an increasing function $\bar{\gamma}$ from $\omega$ into $\gamma$ for each $\gamma \in H$ so that $\operatorname{ran}(\bar{\gamma})$ is cofinal in $\gamma$ for every $\gamma \in H$, and $\{\gamma \in H: \operatorname{ran}(\bar{\gamma}) \subseteq C\}$ is stationary in $\mu^{+}$for any closed unbounded subset $C$ of $\mu^{+}$.

Set $\nu=\operatorname{cf}(\mu)$ and let $\left\langle\mu_{i}: i<\nu\right\rangle,\left\langle h_{\alpha}: \alpha<\mu^{+}\right\rangle$and $S$ be as in the statement of Lemma 3. For $\alpha<\mu^{+}$, set $x_{\alpha}=\operatorname{ran}\left(h_{\alpha}\right)$. For $b \in P_{\kappa}(\mu)$, define $g_{b} \in \prod_{i<\nu} \mu_{i}$ by $g_{b}(i)=\sup \left(b \cap \mu_{i}\right)$. Define $\rho: P_{\kappa}(\mu) \rightarrow \mu^{+}$by $\rho(b)=$ the least $\beta<\mu^{+}$ such that $g_{b} \leq^{*} h_{\beta}$. For $\alpha \in S$ and $b \in P_{\kappa}(\mu)$, define $g_{b}^{\alpha} \in \prod_{i<\nu} h_{\alpha}(i)$ by $g_{b}^{\alpha}(i)=\sup \left(b \cap h_{\alpha}(i)\right)$. For $\alpha \in S$, define $\rho_{\alpha}: P_{\kappa}(\mu) \rightarrow \alpha$ by $\rho_{\alpha}(b)=$ the least $\beta<\mu^{+}$such that $g_{b}^{\alpha} \leq^{*} h_{\beta}$. Note that given any sequence $\left\langle b_{n}: n<\omega\right\rangle$ of elements of $P_{\kappa}(\mu), \rho\left(\bigcup_{n<\omega} b_{n}\right)=\sup \left\{\rho\left(b_{n}\right): n<\omega\right\}$. Moreover, for every $\alpha \in S$, $\rho_{\alpha}\left(\bigcup_{n<\omega} b_{n}\right)=\sup \left\{\rho_{\alpha}\left(b_{n}\right): n<\omega\right\}$.

We will prove that there is a sequence $\left\langle s_{a}: a \in P_{\kappa}(\lambda)\right\rangle$ such that for any $X \subseteq \lambda$,

$$
\left\{a: \rho(\mu \cap a) \in H \quad \text { and } \quad s_{a}=X \cap a\right\} \in N G_{\kappa, \lambda}^{+}
$$

For $n<\omega$ and $0<\zeta<\kappa$, let $F_{n}^{\zeta}$ be the set of all $(n+1)$-tuples $\left(f_{0}, \ldots, f_{n}\right)$ of functions from $\zeta$ to 2 . By Lemma $1, S$ can be partitioned into disjoint stationary subsets $Z_{n}, n<\omega$. Again by Lemma 1 , for each $n, Z_{n}$ can be decomposed into disjoint stationary subsets $Z\left(f_{0}, \ldots, f_{n}\right),\left(f_{0}, \ldots, f_{n}\right) \in \bigcup_{0<\zeta<\kappa} F_{n}^{\zeta}$.

For $b \subseteq \lambda$, let $e(b)$ : o.t. $(b) \rightarrow b$ be the function that enumerates the elements of $b$ in increasing order. For $a, b \in P_{\kappa}(\lambda)$ with $a \subseteq b$, let $\chi(a, b)$ : o.t. (b) $\rightarrow 2$ be defined by $(\chi(a, b))(\delta)=1$ if and only if $(e(b))(\delta) \in a$.

The proof will go as follows. Given $A \in N G_{\kappa, \lambda}^{*}$ and $X \subseteq \lambda$, we will construct $a_{n}$ and $\alpha_{n}$ for $n<\omega, f_{n}^{i}$ for $i \leq n<\omega$, and $a$ and $\gamma$ so that (a) $a_{0}, a_{1}, \ldots \in P_{\kappa}(\lambda)$ and $a_{0} \subseteq a_{1} \subseteq \ldots,(\mathrm{~b}) f_{n}^{i}=\chi\left(a_{i}, a_{n}\right)$ for $i<n$ and $f_{n}^{n}=\chi\left(X \cap a_{n}, a_{n}\right)$, (c) $a=\bigcup_{n<\omega} a_{n}, a \in A$ and $\gamma=\rho(a \cap \mu)$, (d) $\alpha_{n+1}=$ the least $\alpha$ such that $\bar{\gamma}(n)<\alpha<\mu^{+}$and $\operatorname{ran}\left(h_{\alpha}\right) \subseteq a$, and (e) $\alpha_{n+1} \in Z\left(f_{n}^{0}, f_{n}^{1}, \ldots, f_{n}^{n}\right)$.

The guessing sequence $\left\langle s_{a}: a \in P_{\kappa}(\lambda)\right\rangle$ is now defined in the obvious way. Given $a \in P_{\kappa}(\lambda)$, put $\xi=$ o.t. (a) and $\gamma=\rho(a \cap \mu)$. Let $(*)$ assert that $\gamma \in H$ and there exist $\zeta_{n}$ and $\alpha_{n+1}$ for $n<\omega$ and $f_{n}^{i}$ for $i \leq n<\omega$ such that (0) $0<\zeta_{n}<\kappa$, (1) $f_{n}^{i}$ is a function from $\zeta_{n}$ to 2 , (2) $\alpha_{n+1}=$ the least $\alpha<\mu^{+}$such that $\alpha>\bar{\gamma}(n)$ and $\operatorname{ran}\left(h_{\alpha}\right) \subseteq a$, and $(3) \alpha_{n+1} \in Z\left(f_{n}^{0}, f_{n}^{1}, \ldots, f_{n}^{n}\right)$. $s_{a}$ can be any subset of $a$ if $(*)$ does not hold. Now suppose that $(*)$ holds. By induction on $\theta$, define $a_{n}^{\theta}$ for $\theta<\xi$ and $n<\omega$ as follows. Put $a_{n}^{0}=\phi$ for every $n<\omega$. If $\theta$ is an infinite limit ordinal, set $a_{n}^{\theta}=\bigcup_{\eta<\theta} a_{n}^{\eta}$ for all $n<\omega$. Assuming $a_{n}^{\theta}$ has been defined for all $n$, look for a $j<\omega$ such that $(\alpha)$ for $j<n<\omega$, o.t. $\left(a_{n}^{\theta}\right) \in \operatorname{dom}\left(f_{n}^{j}\right)$ and $f_{n}^{j}\left(\right.$ o.t. $\left.\left(a_{n}^{\theta}\right)\right)=1$, and $(\beta)$ for $\ell<j \leq n<\omega$, o.t. $\left(a_{n}^{\theta}\right) \in \operatorname{dom}\left(f_{n}^{\ell}\right)$ and $f_{n}^{\ell}$ (o.t. $\left.\left(a_{n}^{\theta}\right)\right)=0$. If there is no such $j$, set $a_{n}^{\theta+1}=a_{n}^{\theta}$ for every $n<\omega$. If there is one, it must be unique. Set $a_{n}^{\theta+1}=a_{n}^{\theta}$ for $n<j$, and $a_{n}^{\theta+1}=a_{n}^{\theta} \cup\{(e(a))(\theta)\}$ for $j \leq n<\omega$. Finally, set $s_{a}=\bigcup_{n<\omega} s_{n}$, where $s_{n}=\left\{\left(e\left(a_{n}\right)\right)(\eta): \eta \in\right.$ $\operatorname{dom}\left(f_{n}^{n}\right) \cap$ o.t. $\left(a_{n}\right)$ and $\left.f_{n}^{n}(\eta)=1\right\}$.

Now fix $A \in N G_{\kappa, \lambda}^{*}$ and $X \subseteq \lambda$. We must find $a \in A$ such that $s_{a}=X \cap$ $a$. Let $\tau$ be a winning strategy for player II in the game $G_{\kappa, \lambda}(A)$. Define $k$ : $\bigcup_{n<\omega} R_{n+1}^{\mu} \rightarrow P_{\kappa}(\lambda)$ as follows. Set $k(t)=\tau\left(x_{t(0)}\right)$ for any $t \in R_{1}^{\mu}$. Given $0<n<\omega$ and $t \in R_{n+1}^{\mu}$, define $a_{m}$ and $b_{m}$ for $m \leq n$ by: $a_{0}=x_{t(0)}, a_{m}=$ $b_{m-1} \cup x_{t(m)}$ for $m>0$, and $b_{m}=\tau\left(a_{0}, \ldots, a_{m}\right)$, and set $k(t)=b_{n}$.

Define $W_{n}$ for $n<\omega$ by induction as follows. Set $W_{0}=R_{0}^{\mu}, W_{1}=R_{1}^{\mu}$ and

$$
W_{2}=\left\{t \in R_{2}^{\mu}: t(1) \in Z(\chi(X \cap k(t \upharpoonright 1), k(t \upharpoonright 1))\} .\right.
$$

For $n \geq 2$, let $W_{n+1}$ be the set of all $t \in R_{n+1}^{\mu}$ such that $t \upharpoonright n \in W_{n}$ and $t(n)$ belongs to $Z\left(f_{0}, \ldots, f_{n-1}\right)$, where $f_{i}=\chi(k(t \upharpoonright(i+1)), k(t \upharpoonright n))$ for $i<n-1$, and $\left.f_{n-1}=\chi(X \cap k(t \upharpoonright n)), k(t \upharpoonright n)\right)$. Put $T_{0}=\bigcup_{n<\omega} W_{n}$. For $0<r<\omega$, define $\varphi_{r}$ : $T_{0} \cap\left(\bigcup_{r<q<\omega} R_{q}^{\mu}\right) \rightarrow \mu^{+}$by $\varphi_{r}(t)=\rho_{t(r)}(\mu \cap k(t))$. Using Lemma 4 , select $T_{r} \in \mathcal{T}_{\mu}$ and $\psi_{r}: T_{r} \cap R_{r}^{\mu} \rightarrow \mu^{+}$for $0<r<\omega$ so that $T_{r} \subseteq T_{r-1}, T_{r} \cap R_{r}^{\mu}=T_{r-1} \cap R_{r}^{\mu}$, and $\varphi_{r}(t) \leq \psi_{r}(t \upharpoonright r)$ for every $t \in T_{r} \cap\left(\bigcup_{r<q<\omega} R_{q}^{\mu}\right)$. Set $T=\bigcap_{r<\omega} T_{r}$.

Let $C$ be the set of all $\gamma$ with $\kappa<\gamma<\mu^{+}$such that for any $r$ with $0<r<\omega$, and any $t \in T \cap R_{r}^{\mu}$ with $\operatorname{ran}(t) \subseteq \gamma, \rho(\mu \cap k(t))<\gamma, \psi_{r}(t)<\gamma$ and $\{\alpha<\gamma$ : $t \cup\{(r, \alpha)\} \in T\}$ is cofinal in $\gamma$. Since $C$ is a closed unbounded subset of $\mu^{+}$, there is $\gamma \in H$ such that $\operatorname{ran}(\bar{\gamma}) \subseteq C$. Pick $y: \omega \rightarrow \mu^{+}$so that $\{y \upharpoonright m: m<\omega\} \subseteq T$ and $y(0)<\bar{\gamma}(0)<y(1)<\bar{\gamma}(1)<\ldots$. Set $a_{n}=k(y \upharpoonright(n+1))$ for $n<\omega$, and $a=\bigcup_{n<\omega} a_{n}$. Then for each $m<\omega$,

$$
\bar{\gamma}(m)<y(m+1) \leq \rho\left(\mu \cap a_{m+1}\right)<\bar{\gamma}(m+1)
$$

since $x_{y(m+1)} \subseteq a_{m+1}$ and $\operatorname{ran}(y \upharpoonright(m+2)) \subseteq \bar{\gamma}(m+1)$. Hence

$$
\rho(\mu \cap a)=\sup \left\{\rho\left(\mu \cap a_{m+1}\right): m<\omega\right\}=\gamma
$$

For $0<r<\omega$,

$$
\rho_{y(r)}(\mu \cap a)=\sup \left\{\rho_{y(r)}\left(\mu \cap a_{q}\right): r<q<\omega\right\} \leq \bar{\gamma}(r-1)
$$

since $\rho_{y(r)}\left(\mu \cap a_{q}\right)=\varphi_{r}(y \upharpoonright q) \leq \psi_{r}(y \upharpoonright r)<\bar{\gamma}(r-1)$ whenever $r<q<\omega$. It follows that $y(r)=$ the least $\alpha<\mu^{+}$such that $\alpha>\bar{\gamma}(r-1)$ and $x_{\alpha} \subseteq a$, since $\delta \leq \rho_{y(r)}(a \cap \mu)$ for any $\delta<y(r)$ such that $x_{\delta} \subseteq a$. Define $f_{n}^{j}$ for $j \leq$ $n<\omega$ by $f_{n}^{j}=\chi\left(a_{j}, a_{n}\right)$ if $j<n$, and $f_{n}^{n}=\chi\left(X \cap a_{n}, a_{n}\right)$. Then $y(n+1) \in$ $Z\left(f_{n}^{0}, f_{n}^{1}, \ldots, f_{n}^{n}\right)$ for all $n<\omega$. Finally, $s_{a}=\bigcup_{n<\omega}\left\{\left(e\left(a_{n}\right)\right)(\eta): \eta \in\right.$ o.t. $\left(a_{n}\right)$ and $\left.f_{n}^{n}(\eta)=1\right\}=\bigcup_{n<\omega}\left(X \cap a_{n}\right)=X \cap a$.

In the case when $\kappa$ is the successor of a cardinal of cofinality $\omega$, the assumption of Proposition 6 can be weakened.

Let $\nu>0$ be a cardinal. For $A \subseteq P_{\kappa}(\lambda)$, the game $G_{\kappa, \lambda}^{\nu}(A)$ is defined similarly to $G_{\kappa, \lambda}(A)$, where now the choices are made from $P_{\nu}(\lambda)$.

Lemma 7 (Matet [7]). Suppose $\kappa$ is the successor of a cardinal $\nu$ of cofinality $\omega$. Then for any $A \subseteq P_{\kappa}(\lambda), A \in N G_{\kappa, \lambda}^{*}$ if and only if II has a winning strategy in the game $G_{\kappa, \lambda}^{\nu}(A)$.

It is now straightforward to modify the proof of Proposition 6 so as to get the following.

Proposition 8. Suppose that $\kappa$ is the successor of a cardinal $\nu$ of cofinality $\omega$, and $2^{<\nu} \leq \mu^{+}$for some cardinal $\mu$ such that $\omega<\operatorname{cf}(\mu)<\kappa<\mu \leq \lambda$. Then there is a sequence $<s_{a}: a \in P_{\kappa}(\lambda)>$ with $s_{a} \subseteq a$ such that for any $X \subseteq \lambda$, $\left\{a: s_{a}=X \cap a\right\} \in N G_{\kappa, \lambda}^{+}$.
