# LOCAL BOUNDED COMMUTATIVE RESIDUATED $\ell$-MONOIDS 

Jiǩí Rachůnek, Olomouc, Dana Šalounová, Ostrava

(Received February 21, 2005)

#### Abstract

Bounded commutative residuated lattice ordered monoids ( $R \ell$-monoids) are a common generalization of, e.g., $B L$-algebras and Heyting algebras. In the paper, the properties of local and perfect bounded commutative $R \ell$-monoids are investigated.

Keywords: residuated $\ell$-monoid, residuated lattice, $B L$-algebra, $M V$-algebra, local $R \ell$ monoid, filter

MSC 2000: 06D35, 06F05

## 1. Introduction

Commutative residuated lattice ordered monoids ( $R \ell$-monoids) were introduced (in the dual form) by Swamy [15] as a common generalization of Abelian lattice ordered groups and Heyting algebras. Moreover, bounded commutative $R \ell$-monoids are in very close connections with algebras of fuzzy logics, i.e., with $B L$-algebras, and consequently, with $M V$-algebras, which can be viewed as particular cases of such $R \ell$-monoids. Many of important properties of $B L$-algebras are also satisfied in all bounded commutative $R \ell$-monoids. Therefore bounded commutative $R \ell$-monoids could be taken as an algebraic semantics of a more general logic than Hájek's basic fuzzy logic. Hence it is natural to study filters of those $R \ell$-monoids because from the logical point of view they correspond to sets of provable formulas.

Local $B L$-algebras which are characterized e.g. by the property that they contain a unique maximal filter, were studied by Turunen and Sessa [18]. In [12], we have analogously introduced the notion of a local bounded commutative $R \ell$-monoid. In the present paper, we study the properties of those $R \ell$-monoids in connection with the properties of their filters.

[^0]For the notions and results concerning $B L$-algebras and $M V$-algebras see e.g. [3], [4], [7], [17].

## 2. Addition in $R \ell$-monoids

Commutative dually residuated lattice ordered monoids ( $D R \ell$-monoids) were introduced by Swamy in [15] as a common generalization of Abelian $\ell$-groups and Brouwerian algebras. In [9], [10], [11], it was shown that also algebras of fuzzy logics can be viewed as particular cases of bounded commutative $D R \ell$-monoids. For instance, $M V$-algebras coincide with bounded commutative $D R \ell$-monoids satisfying the double negation law, and $B L$-algebras are exactly the duals of subdirect products of linearly ordered bounded commutative $D R \ell$-monoids.

In this paper we deal with a generalization of local $B L$-algebras, hence we use the duals of $D R \ell$-monoids that are called $R \ell$-monoids.

A commutative $R \ell$-monoid is an algebra $M=(M ; \odot, \vee, \wedge, \rightarrow, 1)$ of type $\langle 2,2,2$, $2,0\rangle$ satisfying the following conditions:
(i) $(M ; \odot, 1)$ is a commutative monoid.
(ii) $(M ; \vee, \wedge)$ is a lattice.
(iii) The operation $\odot$ distributes over the operations $\vee$ and $\wedge$.
(iv) $x \odot y \leqslant z$ if and only if $x \leqslant y \rightarrow z$, for any $x, y, z \in M$.
(v) $((x \rightarrow y) \wedge 1) \odot x=x \wedge y$, for any $x, y \in M$.

By [15], commutative $R \ell$-monoids form a variety of algebras of the indicated type. In the paper we will deal with bounded commutative $R \ell$-monoids. It is known that an $R \ell$-monoid $M$ is bounded if and only if it is lower bounded. In such a case, 1 is the greatest element in $M$ and identity (v) is in the form $(x \rightarrow y) \odot x=x \wedge y$. Let us denote by 0 the least element in a bounded $R \ell$-monoid, and consider such $R \ell$-monoids as algebras $M=(M ; \odot, \vee, \wedge, \rightarrow, 0,1)$ of type $\langle 2,2,2,2,0,0\rangle$.

It is possible to show that bounded commutative $R \ell$-monoids are exactly the bounded commutative integral generalized $B L$-algebras in the sense of [8] and [1], and that, according to [2] and [8], condition (iii) in the definition of an $R \ell$-monoid is then for bounded cases superfluous. (See also [5] or [6].) Therefore we can modify the definition of a bounded commutative $R \ell$-monoid as follows.

A bounded commutative $R \ell$-monoid is an algebra $M=(M ; \odot, \vee, \wedge, \rightarrow, 0,1)$ of type $\langle 2,2,2,2,0,0\rangle$ satisfying the following conditions:
(i) $(M ; \odot, 1)$ is a commutative monoid.
(ii) $(M ; \vee, \wedge, 0,1)$ is a bounded lattice.
(iii) $x \odot y \leqslant z$ if and only if $x \leqslant y \rightarrow z$, for any $x, y, z \in M$.
(v) $x \odot(x \rightarrow y)=x \wedge y$, for any $x, y \in M$.

For example, both $B L$-algebras and Heyting algebras are special cases of bounded commutative $R \ell$-monoids, hence the class of bounded commutative $R \ell$-monoids is essentially larger than that of $B L$-algebras.

In the sequel, by an $R \ell$-monoid we will mean a bounded commutative $R \ell$-monoid.
On any $R \ell$-monoid $M$ let us define a unary operation negation ${ }^{-}$by $x^{-}:=x \rightarrow 0$ for any $x \in M$. Further, put $x^{1}:=x$ and $x^{n+1}:=x^{n} \odot x$ for each $n \in \mathbb{N}$.

Lemma 2.1 ([15], [13]). In any bounded commutative $R \ell$-monoid $M$ we have for any $x, y \in M$ :

```
(1) \(x \leqslant y \Longleftrightarrow x \rightarrow y=1\).
(2) \((x \odot y) \rightarrow z=x \rightarrow(y \rightarrow z)=y \rightarrow(x \rightarrow z)\).
(3) \((x \vee y) \rightarrow z=(x \rightarrow z) \wedge(y \rightarrow z)\).
(4) \(x \rightarrow(y \wedge z)=(x \rightarrow y) \wedge(x \rightarrow z)\).
(5) \((x \vee y) \odot(x \wedge y)=x \odot y\).
(6) \((x \rightarrow y) \odot(y \rightarrow z) \leqslant x \rightarrow z\).
(7) \(1^{--}=1,0^{--}=0\).
(8) \(x \leqslant x^{--}, x^{-}=x^{---}\).
(9) \(x \leqslant y \Longrightarrow y^{-} \leqslant x^{-}\).
(10) \((x \vee y)^{-}=x^{-} \wedge y^{-}\).
(11) \((x \wedge y)^{--}=x^{--} \wedge y^{--}\).
(12) \((x \odot y)^{-}=y \rightarrow x^{-}=y^{--} \rightarrow x^{-}=x \rightarrow y^{-}=x^{--} \rightarrow y^{-}\).
(13) \((x \odot y)^{--} \geqslant x^{--} \odot y^{--}\).
(14) \((x \rightarrow y)^{--}=x^{--} \rightarrow y^{--}\).
```

Remark 2.2. By Lemma 2.1 (8), $x \leqslant x^{--}$for any $x \in M$. In [9], [10] it is proved that $M$ satisfies the identity $x^{--}=x$ if and only if $M$ is an $M V$-algebra.

Lemma 2.3. If $M$ is an $R \ell$-monoid then $x \rightarrow y \leqslant(y \rightarrow z) \rightarrow(x \rightarrow z)$, for any $x, y, z \in M$.

Proof. From the definition of an $R \ell$-monoid and from the fact that $M$ is a lattice ordered monoid we have

$$
x \odot(x \rightarrow y) \odot(y \rightarrow z)=(x \wedge y) \odot(y \rightarrow z) \leqslant y \odot(y \rightarrow z)=y \wedge z \leqslant z .
$$

Thus $(x \rightarrow y) \odot(y \rightarrow z) \leqslant x \rightarrow z$, therefore $x \rightarrow y \leqslant(y \rightarrow z) \rightarrow(x \rightarrow z)$.

Corollary 2.4. For any $x, y \in M, x \rightarrow y \leqslant y^{-} \rightarrow x^{-}$.

Proposition 2.5. For any $x, y \in M, x^{-} \rightarrow y^{-}=y^{--} \rightarrow x^{--}$.
Proof. By Corollary 2.4 and Lemma 2.1 (8), $x^{-} \rightarrow y^{-} \leqslant y^{--} \rightarrow x^{--} \leqslant$ $x^{---} \rightarrow y^{---}=x^{-} \rightarrow y^{-}$.

Proposition 2.6. For any $x, y \in M,\left(x^{-} \odot y^{-}\right)^{-}=y^{-} \rightarrow x^{--}=x^{-} \rightarrow y^{--}$.
Proof. It follows from Lemma 2.1 (12).
In any $M V$-algebra there is a binary operation " $\oplus$ " dual to the operation " $\odot$ ". Now we will introduce an operation " $\oplus$ " also for arbitrary $R \ell$-monoids and study its properties.

If $M=(M ; \odot, \vee, \wedge, \rightarrow, 0,1)$ is an $R \ell$-monoid, then we define a binary operation " $\oplus$ " on $M$ as follows:

$$
\forall x, y \in M: x \oplus y:=\left(x^{-} \odot y^{-}\right)^{-}
$$

Lemma 2.7. For any $x, y \in M,(x \oplus y)^{-} \geqslant x^{-} \odot y^{-}$.
Proof. By Lemma 2.1 (8) and (12), $(x \oplus y)^{-}=\left(x^{-} \odot y^{-}\right)^{--} \geqslant x^{-} \odot y^{-}$.
We say that an $R \ell$-monoid $M$ is normal if $M$ satisfies the identity

$$
(x \odot y)^{--}=x^{--} \odot y^{--} .
$$

Remark 2.8. By [13, Proposition 5], every $B L$-algebra and every Heyting algebra is normal, hence the variety of normal $R \ell$-monoids is considerably wide.

Proposition 2.9. Let $M$ be a normal $R \ell$-monoid. Then for any $x, y \in M$,

$$
(x \oplus y)^{-}=x^{-} \odot y^{-}
$$

Proof. By the normality and Lemma 2.1(8), $(x \oplus y)^{-}=\left(x^{-} \odot y^{-}\right)^{--}=x^{-} \odot y^{-}$.

Proposition 2.10. If $M$ is any $R \ell$-monoid, then $(M ; \oplus)$ is a semigroup.
Proof. Let $x, y, z \in M$. Then by Proposition 2.6 and Lemma 2.1 (2),

$$
\begin{aligned}
x \oplus(y \oplus z) & =x \oplus\left(y^{-} \odot z^{-}\right)^{-}=\left(x^{-} \odot\left(y^{-} \odot z^{-}\right)^{--}\right)^{-}=x^{-} \rightarrow\left(y^{-} \odot z^{-}\right)^{-} \\
& =x^{-} \rightarrow\left(z^{-} \rightarrow y^{--}\right)=z^{-} \rightarrow\left(x^{-} \rightarrow y^{--}\right)=z^{-} \rightarrow\left(x^{-} \odot y^{-}\right)^{-} \\
& =\left(\left(x^{-} \odot y^{-}\right)^{--} \odot z^{-}\right)^{-}=\left(x^{-} \odot y^{-}\right)^{-} \oplus z=(x \oplus y) \oplus z .
\end{aligned}
$$

Now we can put $1 \cdot x=x,(n+1) x=n x \oplus x$ for each $n \in \mathbb{N}$.
Let us denote by $R(M)=\left\{x \in M: x^{--}=x\right\}$ the set of all regular elements in $M$. Obviously, $0,1 \in R(M)$. If $M=(M ; \odot, \vee, \wedge, \rightarrow, 0,1)$ is any $R \ell$-monoid, then by $[13$, Proposition 4$], R(M)$ is a subalgebra of the reduct $(M ; \wedge, \rightarrow, 1)$. We will show further properties of the set $R(M)$.

Lemma 2.11. If $M$ is an $R \ell$-monoid and $x, y \in M$, then
(a) $x \oplus 0=x^{--}$;
(b) $(x \oplus y)^{--}=x^{--} \oplus y^{--}=x \oplus y$.

Proof. (a) $x \oplus 0=x \oplus 1^{-}=\left(x^{-} \odot 1^{--}\right)^{-}=\left(x^{-} \odot 1\right)^{-}=x^{--}$.
(b) $(x \oplus y)^{--}=\left(x^{-} \odot y^{-}\right)^{---}=\left(x^{-} \odot y^{-}\right)^{-}=x \oplus y, x^{--} \oplus y^{--}=\left(x^{---} \odot\right.$ $\left.y^{---}\right)^{-}=\left(x^{-} \odot y^{-}\right)^{-}=x \oplus y$.

## Remark 2.12.

a) By the previous lemma and Remark 2.2, 0 is a neutral element of $(M ; \oplus)$ if and only if $M$ is an $M V$-algebra.
b) The sum $x \oplus y$ of any elements $x, y \in M$ belongs to $R(M)$.

Proposition 2.13. If $M$ is an $R \ell$-monoid, then $R(M)$ is a subsemigroup of $(M ; \oplus)$ and $(R(M) ; \oplus, 0)$ is a commutative monoid which, moreover, satisfies the identity $(x \odot y)^{-}=x^{-} \oplus y^{-}$.

Proof. By Lemma 2.11, it is sufficient to prove that $(x \odot y)^{-}=x^{-} \oplus y^{-}$. (It is obvious that $(x \odot y)^{-}, x^{-}$and $y^{-}$belong to $R(M)$.) Let $x, y \in R(M)$. Then $(x \odot y)^{-}=\left(x^{--} \odot y^{--}\right)^{-}=x^{-} \oplus y^{-}$.

Remark 2.14. Let an $R \ell$-monoid be normal. Then by [13, Theorem 7 ], $R(M)=$ $\left(R(M) ; \odot, \vee_{R(M)}, \wedge, \rightarrow, 0,1\right)$, where $y \vee_{R(M)} z=:(y \vee z)^{--}$for any $y, z \in R(M)$ and the other operations are restrictions of the operations on $M$, is an $M V$-algebra. In such a case, the operation " $\odot$ " on $R(M)$ is the dual operation to the operation " $\odot$ ".

Proposition 2.15 ([13, Proposition 2]). If $M$ is an $R \ell$-monoid, then the following conditions are equivalent for any $x, y \in M$.
(1) $(x \vee y)^{--}=x^{--} \vee y^{--}$.
(2) $(x \wedge y)^{-}=x^{-} \vee y^{-}$.
(3) $(x \wedge y)^{-} \odot((x \rightarrow y) \vee(y \rightarrow x))=(x \wedge y)^{-}$.

Every $B L$-algebra satisfies the identity $(x \rightarrow y) \vee(y \rightarrow x)=1$, therefore it also satisfies the identities (1), (2) and (3) from the previous proposition. (See also [13, Proposition 2].)

Proposition 2.16. If an $R \ell$-monoid $M$ satisfies the identities from Proposition 2.15, then the operation " $\oplus$ " distributes over the operations " $\vee$ " and " $\wedge$ ", hence $(M ; \oplus, \vee, \wedge)$ is a lattice ordered monoid.

Proof. If $x, y, z \in M$ then by Lemma 2.1 (10),

$$
\begin{aligned}
x \oplus(y \vee z) & =\left(x^{-} \odot(y \vee z)^{-}\right)^{-}=\left(x^{-} \odot\left(y^{-} \wedge z^{-}\right)\right)^{-}=\left(\left(x^{-} \odot y^{-}\right) \wedge\left(x^{-} \odot z^{-}\right)\right)^{-} \\
& =\left(x^{-} \odot y^{-}\right)^{-} \vee\left(x^{-} \odot z^{-}\right)^{-}=(x \oplus y) \vee(x \oplus z), \\
x \oplus(y \wedge z) & =\left(x^{-} \odot(y \wedge z)^{-}\right)^{-}=\left(x^{-} \odot\left(y^{-} \vee z^{-}\right)\right)^{-}=\left(\left(x^{-} \odot y^{-}\right) \vee\left(x^{-} \odot z^{-}\right)\right)^{-} \\
& =\left(x^{-} \odot y^{-}\right)^{-} \wedge\left(x^{-} \odot z^{-}\right)^{-}=(x \oplus y) \wedge(x \oplus z) .
\end{aligned}
$$

## 3. Properties of local $R \ell$-monoids

If $M$ is an $R \ell$-monoid and $\emptyset \neq F \subseteq M$, then $F$ is called a filter of $M$ if
(i) $x, y \in F \Longrightarrow x \odot y \in F$;
(ii) $x \in F, y \in M, x \leqslant y \Longrightarrow y \in F$.

By [5], the filters of $M$ are exactly all deductive systems of $M$, i.e. $F \subseteq M$ is a filter of $M$ if and only if
(1) $1 \in F$;
(2) $x \in F, x \rightarrow y \in F \Longrightarrow y \in F$.

Furthermore, by [16], the filters of $R \ell$-monoids coincide with the kernels of their congruences. If $F$ is a filter of $M$ then $F$ is the kernel of the unique congruence $\theta(F)$ such that $\langle x, y\rangle \in \theta(F)$ if and only if $(x \rightarrow y) \wedge(y \rightarrow x) \in F$ for any $x, y \in M$. Hence we will consider quotient $R \ell$-monoids $M / F$ of $R \ell$-monoids $M$ with respect to their filters $F$.

If for a filter $F$ the quotient $R \ell$-monoid is an $M V$-algebra, then $F$ is called an MV-filter.

An element $x \in M$ is called dense if $x^{--}=1$. Denote by $D(M)$ the set of all dense elements in $M$. By [13, Theorem 8] and [14, Remark to Theorem 10], or by [5, Proposition 3.3], $D(M)$ is a proper $M V$-filter of $M$. Moreover, a filter $F$ of an $R \ell$-monoid $M$ is an $M V$-filter if and only if $D(M) \subseteq F$.

Let us recall that an $R \ell$-monoid $M$ is called local if $M$ contains a unique maximal filter. (See [12].)

Let us put

$$
A(M):=\left\{x \in M: x^{n} \neq 0 \text { for every } n \in \mathbb{N}\right\} .
$$

Define $\operatorname{ord}(x)$, the order of an element $x \in M$, as follows: $\operatorname{ord}(x)$ is the smallest $n \in \mathbb{N}$ such that $x^{n}=0$; otherwise $\operatorname{ord}(x)=\infty$. Hence $A(M)$ is the set of all elements $x \in M$ such that $\operatorname{ord}(x)=\infty$. We have $0 \notin A(M)$, thus $A(M) \neq M$.

Proposition 3.1 ([12, Theorem 3.9]). If $M$ is an $R \ell$-monoid then the following conditions are equivalent.
(1) $M$ is local.
(2) $A(M)$ is a filter of $M$.
(3) $A(M)$ is the unique maximal filter of $M$.
(4) If $x^{n} \neq 0 \neq y^{n}$ for every $n \in \mathbb{N}$, then $x^{n} \odot y^{n} \neq 0$ for all $n \in \mathbb{N}$.

Corollary 3.2. If $M$ is a local $R \ell$-monoid, then for any element $x \in M$, $\operatorname{ord}(x)<\infty$ or $\operatorname{ord}\left(x^{-}\right)<\infty$.

Denote

$$
A(M)^{-}:=\left\{x \in M: x \leqslant y^{-} \text {for some } y \in A(M)\right\} .
$$

Let us define now the notion of an ideal of an $R \ell$-monoid $M$. If $M$ is an $R \ell$-monoid and $\emptyset \neq I \subseteq M$, then $I$ is called an ideal of $M$ if
(i) $x, y \in I \Longrightarrow x \oplus y \in I$;
(ii) $x \in I, z \in M, z \leqslant x \Longrightarrow z \in I$.

Proposition 3.3. If $M$ is a local $R \ell$-monoid then $A(M)^{-}$is an ideal of $M$ and $A(M) \cap A(M)^{-}=\emptyset$.

Proof. $\quad 0 \in A(M)^{-}$, hence $A(M)^{-} \neq \emptyset$. Let $x, y \in A(M)^{-}$. Then $x \leqslant v^{-}$and $y \leqslant w^{-}$for some elements $v, w \in A(M)$. Thus by Lemma 2.1 (8) and (9),

$$
x \oplus y \leqslant v^{-} \oplus w^{-}=\left(v^{--} \odot w^{--}\right)^{-} \leqslant(v \odot w)^{-},
$$

and since $A(M)$ is by Proposition 3.1 a filter of $M$, we have $x \oplus y \in A(M)^{-}$.
Let $x \in M, y \in A(M)^{-}, x \leqslant y$ and $y \leqslant z^{-}$, where $z \in A(M)$. Then $x \leqslant z^{-}$, hence $x \in A(M)$.

Therefore $A(M)^{-}$is an ideal of $M$.
Let $M$ be an $R \ell$-monoid and let $F$ be a filter of $M$. Then $F$ is called a primary filter if it is satisfied for any $x, y \in M$ : If there is $n \in \mathbb{N}$ such that $n(x \oplus y) \in F$, then there is $m \in \mathbb{N}$ such that $m x \in F$ or $m y \in F$.

Proposition 3.4. For any $R \ell$-monoid $M$ and any $M V$-filter $F$ of $M$, the following conditions are equivalent.
(1) $M / F$ is a local $R \ell$-monoid.
(2) $F$ is a primary filter.

Proof. (1) $\Rightarrow(2)$ : Let $F$ be a filter of $M$ such that $M / F$ is local. Let us suppose that $x, y \in M, n \in \mathbb{N}$ and $n(x \oplus y) \in F$, i.e., $n(x \oplus y) / F$ is the greatest element 1 in $M / F$. Then $\left(x^{-} \odot y^{-}\right)^{n} / F$ is the smallest element 0 in $M / F$, and since $M / F$ is local, there exists $m \in \mathbb{N}$ such that $\left(x^{-} / F\right)^{m}=0$ or $\left(y^{-} / F\right)^{m}=0$. Since $F$ is an $M V$-filter, this implies that there is $m \in \mathbb{N}$ such that $m x \in F$ or $m y \in F$. Therefore $F$ is a primary filter.
$(2) \Rightarrow(1)$ : Let $F$ be a primary $M V$-filter. Suppose that $x, y \in M$ and that there exists $n \in \mathbb{N}$ such that $(x / F \odot y / F)^{n}=0$. Then $n\left(x^{-} / F \oplus y^{-} / F\right)=F$, i.e., $n\left(x^{-} \oplus y^{-}\right) \in F$, hence there is $m \in \mathbb{N}$ such that $m x^{-} \in F$ or $m y^{-} \in F$. This yields $(x / F)^{m}=0$ or $(y / F)^{m}=0$, and thus $M / F$ is local.

Theorem 3.5. Let $M$ be an $R \ell$-monoid. Then the following conditions are equivalent.
(1) Every $M V$-filter of $M$ is primary.
(2) $D(M)$ is a primary filter.
(3) $M / D(M)$ is a local $M V$-algebra.

Proof. $\quad(1) \Rightarrow(2)$ : It follows from the fact that $D(M)$ is the least $M V$-filter of $M$.
$(2) \Leftrightarrow(3)$ : By Proposition 3.4.
$(3) \Rightarrow(1)$ : If $F$ is an $M V$-filter of $M$, then $D(M) \subseteq F$, hence by the isomorphism theorems for algebras we get that $M / F$ also contains a unique maximal filter, which means $F$ is primary.

Proposition 3.6. Let $M$ be an $R \ell$-monoid.
a) If $M$ is local then it satisfies the equivalent conditions from Theorem 3.5.
b) If $\{1\}$ is a primary $M V$-filter then $M$ is a local $M V$-algebra.

Proof. a) Let an $R \ell$-monoid $M$ be local, let $F$ be a filter of $M, x, y \in M$, $n \in \mathbb{N}$ and let $n(x \oplus y) \in F$. Then $\operatorname{ord}(n(x \oplus y))=\infty$, hence $\operatorname{ord}\left(\left(x^{-} \odot y^{-}\right)^{n}\right)<\infty$. Since $M$ is local, we get $\operatorname{ord}\left(x^{-}\right)<\infty$ or ord $\left(y^{-}\right)<\infty$. That is, there is $m \in \mathbb{N}$ such that $\left(x^{-}\right)^{m}=0$ or $\left(y^{-}\right)^{m}=0$.

Therefore, if $F$ is an $M V$-filter then $m x=1 \in F$ or $m y=1 \in F$ for some $m \in \mathbb{N}$, and thus $F$ is a primary filter of $M$.
b) If $\{1\}$ is an $M V$-filter then $D(M)=\{1\}$. Hence the assertion is a direct consequence of Theorem 3.5.

Proposition 3.7. Every linearly ordered $R \ell$-monoid is a local $B L$-algebra.
Proof. Let $M$ be a linearly ordered $R \ell$-monoid. By [11], $B L$-algebras are exactly all $R \ell$-monoids which are subdirect products of linearly ordered $R \ell$-monoids. Hence $M$ is a $B L$-algebra.

Let $x, y \in M, n \in \mathbb{N}$ and let $(x \odot y)^{n}=0$. Since $x \leqslant y$ or $y \leqslant x$, we have $(x \odot y)^{n} \geqslant x^{2 n}$ or $(x \odot y)^{n} \geqslant y^{2 n}$, thus ord $(x)<\infty$ or ord $(y)<\infty$. Therefore by [12, Theorem 3.9], $M$ is local.

Let $M$ be a local $R \ell$-monoid. Then $M$ is called
a) perfect if for any $x \in M$, ord $(x)<\infty$ implies $\operatorname{ord}\left(x^{-}\right)=\infty$;
b) singular if there exist $x, y \in M$ such that $\operatorname{ord}(x)<\infty$, ord $(y)<\infty$ and $\operatorname{ord}(x \oplus y)=\infty$.

Proposition 3.8. Every local $R \ell$-monoid $M$ is either perfect or singular and there is no $M$ having both properties.

Proof. (a) Let $M$ be a local $R \ell$-monoid which is not singular. Then $\operatorname{ord}(y)=\infty$ or $\operatorname{ord}(z)=\infty$ or $\operatorname{ord}(y \oplus z)<\infty$ for every $y, z \in M$.

If $x$ is any element in $M$ then

$$
\operatorname{ord}\left(x \oplus x^{-}\right)=\operatorname{ord}\left(\left(x^{-} \odot x^{--}\right)^{-}\right)=\operatorname{ord}\left(0^{-}\right)=\operatorname{ord}(1)=\infty,
$$

hence $\operatorname{ord}(x)=\infty$ or $\operatorname{ord}\left(x^{-}\right)=\infty$.
Therefore $M$ is perfect.
(b) Let now $M$ be a local $R \ell$-monoid that is simultaneously perfect and singular. Then there exist $x, y \in M$ such that ord $(x)<\infty$, ord $(y)<\infty$ and $\operatorname{ord}(x \oplus y)=\infty$, and hence $\operatorname{ord}\left(x^{-}\right)=\operatorname{ord}\left(y^{-}\right)=\infty$ and $\operatorname{ord}\left((x \oplus y)^{-}\right)<\infty$. By Proposition 2.9, $(x \oplus y)^{-}=x^{-} \odot y^{-}$, hence we get, because $M$ is local, ord $\left(x^{-}\right)<\infty$ or $\operatorname{ord}\left(y^{-}\right)<\infty$, a contradiction.

Let $M$ be an $R \ell$-monoid and $F$ a filter of $M$. Then $F$ is called a perfect filter if it is primary and if, for each $x \in M$, there is $n \in \mathbb{N}$ with $n x \in F$ if and only if $m x^{-} \notin F$ for each $m \in \mathbb{N}$.

Theorem 3.9. Let $M$ be an $R \ell$-monoid and $F$ an $M V$-filter of $M$. Then the following conditions are equivalent.
(1) $M / F$ is a perfect $R \ell$-monoid.
(2) $F$ is a perfect filter.

Proof. (1) $\Rightarrow(2)$ : Let $F$ be an $M V$-filter of $M$ and let $M / F$ be a perfect $R \ell$-monoid. Then $M / F$ is local by definition, and thus, by Proposition 3.4, $F$ is a primary filter.

Let $x \in M, n \in \mathbb{N}$ and $n x \in F$. Then $n x / F=1$ and $\left(x^{-}\right)^{n} / F=0$ in $M / F$. Hence $\operatorname{ord}\left(x^{-} / F\right)<\infty$, and since $M / F$ is perfect, $\operatorname{ord}\left(x^{--} / F\right)=\infty$. Moreover, $F$ is an $M V$-filter, thus also $\operatorname{ord}(x / F)=\infty$, therefore $x^{n} / F \neq 0$ for each $n \in \mathbb{N}$. This implies $n x^{-} / F \neq 1$, thus $n x^{-} \notin F$ for each $n \in \mathbb{N}$.

The converse implication can be proved analogously, and therefore $F$ is perfect.
$(2) \Rightarrow(1)$ : Let $F$ be perfect. Then $F$ is primary, and since it is an $M V$-filter, we get, by Proposition 3.4, that $M / F$ is a local $R \ell$-monoid. Let $x \in M$ and $\operatorname{ord}\left(x^{-} / F\right)<\infty$. Then there is $n \in \mathbb{N}$ such that $\left(x^{-}\right)^{n} / F=0$ in $M / F$, hence $n x / F=1$. Thus there exists $n \in \mathbb{N}$ such that $n x \in F$, therefore $m x^{-} \notin F$ for every $m \in \mathbb{N}$. This implies $m x^{-} / F \neq 1$ and $x^{m} / F \neq 0$ for every $m \in \mathbb{N}$. Therefore $\operatorname{ord}(x / F)=\infty$ in $M / F$. That is, $M / F$ is perfect.

Theorem 3.10. Let $M$ be a local $R \ell$-monoid. Then the following conditions are equivalent.
(a) $M$ is perfect.
(b) $M=A(M) \cup A(M)^{-}$.

Proof. (a) $\Rightarrow(\mathrm{b})$ : Let $M$ be perfect and $x \in M \backslash A(M)$. Then $x^{-} \in A(M)$. We have $x \leqslant x^{--}=\left(x^{-}\right)^{-}$and $x^{-} \in A(M)$, hence $x \in A(M)^{-}$. Therefore $M=$ $A(M) \cup A(M)^{-}$.
(b) $\Rightarrow$ (a): Since $M$ is local, $A(M)$ is by [12, Theorem 3.9] a filter of $M$, and by Proposition 3.3, $A(M)^{-}$is an ideal of $M$ and $A(M) \cap A(M)^{-}=\emptyset$. Thus by the assumption, we get $A(M)^{-}=\{y \in M: \operatorname{ord}(y)<\infty\}$. Let $x \in M$.

If $\operatorname{ord}(x)=\operatorname{ord}\left(x^{-}\right)=\infty$, then $x, x^{-} \in A(M)$, thus $0 \in A(M)$, a contradiction.
If $\operatorname{ord}(x)<\infty$ and $\operatorname{ord}\left(x^{-}\right)<\infty$, then $x, x^{-} \in A(M)^{-}$, and hence $1 \in A(M)^{-}$, a contradiction.

Therefore $\operatorname{ord}(x)<\infty$ if and only if $\operatorname{ord}\left(x^{-}\right)=\infty$, and this means that $M$ is perfect.

If $M$ is an $R \ell$-monoid and $F$ is a proper filter of $M$, set (analogously as for $A(M)$ )

$$
F^{-}:=\left\{x \in M: x \leqslant y^{-} \text {for some } y \in F\right\} .
$$

Obviously $F \cap F^{-}=\emptyset$.
An $R \ell$-monoid $M$ is called bipartite if $M=F \cup F^{-}$for some maximal filter of $M$, and it is called strongly bipartite if $M=F \cup F^{-}$for every maximal filter of $M$.

A filter $F$ of $M$ is called a Boolean filter if $x \vee x^{-} \in F$ for any $x \in M$ (or, equivalently, if $M / F$ is a Boolean algebra [12, Theorem 3.2]).

Theorem 3.11. Let $M$ be a local $R \ell$-monoid. Then the following conditions are equivalent.
(1) $M$ is perfect.
(2) $M$ is (strongly) bipartite.
(3) $A(M)$ is a Boolean filter.
(4) For any element $x \in M, x \in A(M)$ or $x^{-} \in A(M)$.

Proof. (1) $\Leftrightarrow(2)$ : By [12, Theorem 3.9], $A(M)$ is a unique maximal filter of $M$, hence the equivalence follows from Theorem 3.10.
$(2) \Leftrightarrow(3)$ : By [12, Theorem 3.8], any $R \ell$-monoid $M$ is strongly bipartite if and only if every maximal filter of $M$ is Boolean.
$(3) \Leftrightarrow(4):$ If $M$ is an $R \ell$-monoid and $F$ is a filter of $M$ then by [12, Theorem 3.3], $F$ is maximal and Boolean if and only if $F$ is a proper filter such that $x \in F$ or $x^{-} \in F$ for every $x \in M$.
