# A SIMPLE FORMULA FOR AN ANALOGUE OF CONDITIONAL WIENER INTEGRALS AND ITS APPLICATIONS II 

Dong Hyun Cho, Suwon Korea

(Received August 30, 2007)

#### Abstract

Let $C[0, T]$ denote the space of real-valued continuous functions on the interval $[0, T]$ with an analogue $w_{\varphi}$ of Wiener measure and for a partition $0=t_{0}<t_{1}<\ldots<t_{n}<$ $t_{n+1}=T$ of $[0, T]$, let $X_{n}: C[0, T] \rightarrow \mathbb{R}^{n+1}$ and $X_{n+1}: C[0, T] \rightarrow \mathbb{R}^{n+2}$ be given by $X_{n}(x)=\left(x\left(t_{0}\right), x\left(t_{1}\right), \ldots, x\left(t_{n}\right)\right)$ and $X_{n+1}(x)=\left(x\left(t_{0}\right), x\left(t_{1}\right), \ldots, x\left(t_{n+1}\right)\right)$, respectively.

In this paper, using a simple formula for the conditional $w_{\varphi}$-integral of functions on $C[0, T]$ with the conditioning function $X_{n+1}$, we derive a simple formula for the conditional $w_{\varphi}$-integral of the functions with the conditioning function $X_{n}$. As applications of the formula with the function $X_{n}$, we evaluate the conditional $w_{\varphi}$-integral of the functions of the form $F_{m}(x)=\int_{0}^{T}(x(t))^{m} \mathrm{~d} t$ for $x \in C[0, T]$ and for any positive integer $m$. Moreover, with the conditioning $X_{n}$, we evaluate the conditional $w_{\varphi}$-integral of the functions in a Banach algebra $\mathscr{S}_{w_{\varphi}}$ which is an analogue of the Cameron and Storvick's Banach algebra $\mathscr{S}$. Finally, we derive the conditional analytic Feynman $w_{\varphi}$-integrals of the functions in $\mathscr{S} w_{\varphi}$.

Keywords: analogue of Wiener measure, Cameron-Martin translation theorem, conditional analytic Feynman $w_{\varphi}$-integral, conditional Wiener integral, Kac-Feynman formula, simple formula for conditional $w_{\varphi}$-integral

MSC 2010: 28C20

## 1. Introduction and preliminaries

Let $C_{0}[0, T]$ be the space of real-valued continuous functions $x$ on $[0, T]$ with $x(0)=0$. It is well-known that the space $C_{0}[0, T]$ is equipped with the Wiener measure which is a probability measure. On the space, Yeh introduced an inversion formula that a conditional expectation can be found by a Fourier-transform ([11]). As applications of the formula he obtained very useful results including the KacFeynman integral equation and the conditional Cameron-Martin translation theorem using the inversion formula ([12], [13]). But Yeh's inversion formula is very complicated in its applications when the conditioning function is vector-valued.

Let $\tau: 0=t_{0}<t_{1}<\ldots<t_{n}<t_{n+1}=T$ be a partition of the interval $[0, T]$. In [9], Park and Skoug derived a simple formula for conditional Wiener integrals on $C_{0}[0, T]$ with the conditioning function $X_{\tau}: C_{0}[0, T] \rightarrow \mathbb{R}^{n+1}$ given by

$$
X_{\tau}(x)=\left(x\left(t_{1}\right), \ldots, x\left(t_{n}\right), x\left(t_{n+1}\right)\right)
$$

This formula expresses the conditional Wiener integrals directly in terms of ordinary Wiener integrals. Using the formula, they generalized the Kac-Feynman formula and obtained a Cameron-Martin type translation theorem for conditional Wiener integrals.

On the other hand, let $C[0, T]$ denote the space of real-valued continuous functions on the interval $[0, T]$. Im and Ryu introduced a probability measure $w_{\varphi}$ on $(C[0, T]$, $\mathscr{B}(C[0, T]))$ where $\mathscr{B}(C[0, T])$ denotes Borel $\sigma$-algebra on $C[0, T]$ and $\varphi$ is a probability measure on $(\mathbb{R}, \mathscr{B}(\mathbb{R}))([7],[10])$. This measure space is a generalization of the Wiener space. In [7], they derived a translation theorem of $w_{\varphi}$-integral, which corresponds to the Cameron-Martin's translation theorem on the Wiener space ([2]). And also, Im and Ryu evaluated the conditional $w_{\varphi}$-integral of functions of the form

$$
\begin{equation*}
F_{m}(x)=\int_{0}^{T}(x(t))^{m} \mathrm{~d} t \quad(m=1,2) \tag{1.1}
\end{equation*}
$$

on $C[0, T]$ with the conditioning function $X_{n}: C[0, T] \rightarrow \mathbb{R}^{n+1}$ given by

$$
\begin{equation*}
X_{n}(x)=\left(x\left(t_{0}\right), x\left(t_{1}\right), \ldots, x\left(t_{n}\right)\right) \tag{1.2}
\end{equation*}
$$

and $X_{n+1}: C[0, T] \rightarrow \mathbb{R}^{n+2}$ given by

$$
\begin{equation*}
X_{n+1}(x)=\left(x\left(t_{0}\right), x\left(t_{1}\right), \ldots, x\left(t_{n}\right), x\left(t_{n+1}\right)\right), \tag{1.3}
\end{equation*}
$$

and derived a translation theorem of conditional $w_{\varphi}$-integral when the conditioning function is $X(x)=x(T)$. But their methods were complicated in the proofs.

In [5], the author derived a simple formula for the conditional $w_{\varphi}$-integral of the functions on $C[0, T]$ with the vector-valued conditioning function $X_{n+1}$ given by (1.3). This formula expresses the conditional $w_{\varphi}$-integral directly in terms of nonconditional $w_{\varphi}$-integral. As applications of the formula, he evaluated the conditional $w_{\varphi}$-integrals of the functions given by (1.1) for any positive integer $m$ and using the translation theorem of $w_{\varphi}$-integral in [7], he also derived a translation theorem for the conditional $w_{\varphi}$-integral of functions on $C[0, T]$. But, there are no known simple formulas for the conditional $w_{\varphi}$-integral with the conditioning function $X_{n}$ given by (1.2).

In this paper, using the simple formula ([5]) for the conditional $w_{\varphi}$-integral of the functions on $C[0, T]$ with the conditioning function $X_{n+1}$, we derive a simple formula for the conditional $w_{\varphi}$-integral of the functions with the conditioning function $X_{n}$. As applications of the formula with the function $X_{n}$, we evaluate the conditional $w_{\varphi^{-}}$ integrals of the functions $F_{m}$ given by (1.1) for any positive integer $m$. Moreover, on $C[0, T]$, we evaluate the conditional $w_{\varphi}$-integrals of the functions in a Banach algebra $\mathscr{S}_{w_{\varphi}}$ which is an analogue of the Cameron and Storvick's Banach algebra $\mathscr{S}$ in [3]. And then, we evaluate the conditional analytic Feynman $w_{\varphi}$-integrals of the functions in the Banach algebra $\mathscr{S}_{w_{\varphi}}$.

Throughout this paper, let $\mathbb{C}$ and $\mathbb{C}_{+}$denote the set of complex numbers and that of complex numbers with positive real parts, respectively.

Now, we begin with introducing the probability space $\left(C[0, T], \mathscr{B}(C[0, T]), w_{\varphi}\right)$. For a positive real $T$, let $C=C[0, T]$ be the space of all real-valued continuous functions on the closed interval $[0, T]$ with the supremum norm. For $\vec{t}=\left(t_{0}, t_{1}, \ldots, t_{n}\right)$ with $0=t_{0}<t_{1}<\ldots<t_{n} \leqslant T$, let $J_{\vec{t}}: C[0, T] \rightarrow \mathbb{R}^{n+1}$ be the function given by

$$
J_{\vec{t}}(x)=\left(x\left(t_{0}\right), x\left(t_{1}\right), \ldots, x\left(t_{n}\right)\right) .
$$

For $B_{j}(j=0,1, \ldots, n)$ in $\mathscr{B}(\mathbb{R})$, the subset $J_{\vec{t}}^{-1}\left(\prod_{j=0}^{n} B_{j}\right)$ of $C[0, T]$ is called an interval and let $\mathscr{I}$ be the set of all such intervals. For a probability measure $\varphi$ on $(\mathbb{R}, \mathscr{B}(\mathbb{R})$ ), we let

$$
m_{\varphi}\left[J_{\vec{t}}^{-1}\left(\prod_{j=0}^{n} B_{j}\right)\right]=\int_{B_{0}} \int_{\prod_{j=1}^{n} B_{j}} W_{n}\left(\vec{t} ; u_{0}, u_{1}, \ldots, u_{n}\right) d\left(u_{1}, \ldots, u_{n}\right) \mathrm{d} \varphi\left(u_{0}\right)
$$

where

$$
\begin{equation*}
W_{n}\left(\vec{t} ; u_{0}, u_{1}, \ldots, u_{n}\right)=\left[\prod_{j=1}^{n} \frac{1}{2 \pi\left(t_{j}-t_{j-1}\right)}\right]^{1 / 2} \exp \left\{-\frac{1}{2} \sum_{j=1}^{n} \frac{\left(u_{j}-u_{j-1}\right)^{2}}{t_{j}-t_{j-1}}\right\} \tag{1.4}
\end{equation*}
$$

It can be shown that $\mathscr{B}(C[0, T])$, the Borel $\sigma$-algebra of $C[0, T]$, coincides with the smallest $\sigma$-algebra generated by $\mathscr{I}$ and there exists a unique probability measure $w_{\varphi}$ on $(C[0, T], \mathscr{B}(C[0, T]))$ such that $w_{\varphi}(I)=m_{\varphi}(I)$ for all $I$ in $\mathscr{I}([7],[10],[14])$. This measure $w_{\varphi}$ is called an analogue of Wiener measure associated with the probability measure $\varphi$.

By the change of variable theorem, we can easily prove the following theorem.

Theorem 1.1 ([7, Lemma 2.1]). If $f: \mathbb{R}^{n+1} \rightarrow \mathbb{C}$ is a Borel measurable function then we have

$$
\begin{array}{rl}
\int_{C} & f\left(x\left(t_{0}\right), x\left(t_{1}\right), \ldots, x\left(t_{n}\right)\right) \mathrm{d} w_{\varphi}(x) \\
& \stackrel{*}{=} \int_{\mathbb{R}} \int_{\mathbb{R}^{n}} f\left(u_{0}, u_{1}, \ldots, u_{n}\right) W_{n}\left(\vec{t} ; u_{0}, u_{1}, \ldots, u_{n}\right) \mathrm{d}\left(u_{1}, \ldots, u_{n}\right) \mathrm{d} \varphi\left(u_{0}\right)
\end{array}
$$

where $\stackrel{*}{=}$ means that if either side exists then both sides exist and they are equal.
Let $\left\{e_{k}: k=1,2, \ldots\right\}$ be a complete orthonormal subset of $L_{2}[0, T]$ such that each $e_{k}$ is of bounded variation. For $f$ in $L_{2}[0, T]$ and $x$ in $C[0, T]$, we let

$$
(f, x)=\lim _{n \rightarrow \infty} \int_{0}^{T}\left[\sum_{k=1}^{n} e_{k}(t) \int_{0}^{T} f(s) e_{k}(s) \mathrm{d} s\right] \mathrm{d} x(t)
$$

if the limit exists. $(f, x)$ is called the Paley-Wiener-Zygmund integral of $f$ according to $x$.

Applying Theorem 3.5 in [7], we can easily prove the following theorem.

Theorem 1.2. Let $\left\{h_{1}, h_{2}, \ldots, h_{n}\right\}$ be an orthonormal system of $L_{2}[0, T]$. For $i=1,2, \ldots, n$, let $Z_{i}(x)=\left(h_{i}, x\right)$. Then $Z_{1}, Z_{2}, \ldots, Z_{n}$ are independent and each $Z_{i}$ has the standard normal distribution. Moreover, if $f: \mathbb{R}^{n} \rightarrow \mathbb{R}$ is Borel measurable, then we have

$$
\begin{array}{rl}
\int_{C} & f\left(Z_{1}(x), Z_{2}(x), \ldots, Z_{n}(x)\right) \mathrm{d} w_{\varphi}(x) \\
& \stackrel{*}{=}\left(\frac{1}{2 \pi}\right)^{n / 2} \int_{\mathbb{R}^{n}} f\left(u_{1}, u_{2}, \ldots, u_{n}\right) \exp \left\{-\frac{1}{2} \sum_{j=1}^{n} u_{j}^{2}\right\} \mathrm{d}\left(u_{1}, u_{2}, \ldots, u_{n}\right),
\end{array}
$$

where $\stackrel{*}{=}$ means that if either side exists then both sides exist and they are equal.
Let $F: C[0, T] \rightarrow \mathbb{C}$ be integrable and let $X$ be a random vector on $C[0, T]$. Then, we have the conditional expectation $E[F \mid X]$ of $F$ given $X$ from a well-known probability theory ( $[8]$ ). Further, there exists a $P_{X}$-integrable complex-valued function $\psi$ on the value space of $X$ such that $E[F \mid X](x)=(\psi \circ X)(x)$ for $w_{\varphi}$-a.e. $x \in C[0, T]$, where $P_{X}$ is the probability distribution of $X$ on the value space of $X$. The function $\psi$ is called the conditional $w_{\varphi}$-integral of $F$ given $X$ and it is also denoted by $E[F \mid X]$.

## 2. Simple formulas for conditional $w_{\varphi}$-Integrals

In this section, we derive a simple formula for the conditional $w_{\varphi}$-integrals of the functions on $C[0, T]$ with the conditioning function $X_{n}$ given by (1.2).

For a given partition $0=t_{0}<t_{1}<\ldots<t_{n}<t_{n+1}=T$ of $[0, T]$ and for $x$ in $C[0, T]$, define the polygonal function $[x]$ on $[0, T]$ by

$$
[x](t)=x\left(t_{j-1}\right)+\frac{t-t_{j-1}}{t_{j}-t_{j-1}}\left(x\left(t_{j}\right)-x\left(t_{j-1}\right)\right), \quad t_{j-1} \leqslant t \leqslant t_{j}, j=1, \ldots, n+1 .
$$

Similarly, for $\vec{\xi}_{n+1}=\left(\xi_{0}, \xi_{1}, \ldots, \xi_{n+1}\right) \in \mathbb{R}^{n+2}$, define the polygonal function $\left[\vec{\xi}_{n+1}\right]$ on $[0, T]$ by

$$
\left[\vec{\xi}_{n+1}\right](t)=\xi_{j-1}+\frac{t-t_{j}}{t_{j}-t_{j-1}}\left(\xi_{j}-\xi_{j-1}\right), \quad t_{j-1} \leqslant t \leqslant t_{j-1}, j=1, \ldots, n+1
$$

Then both $[x]$ and $\left[\vec{\xi}_{n+1}\right]$ are continuous on $[0, T]$, their graphs are line segments on each subinterval $\left[t_{j-1}, t_{j}\right]$ and $[x]\left(t_{j}\right)=x\left(t_{j}\right)$ and $\left[\vec{\xi}_{n+1}\right]\left(t_{j}\right)=\xi_{j}$ at each $t_{j}$.

To derive the desired simple formula, we begin with letting for $t_{j-1} \leqslant t \leqslant t_{j}$

$$
\begin{equation*}
\Gamma_{j}(t)=\frac{\left(t_{j}-t\right)\left(t-t_{j-1}\right)}{t_{j}-t_{j-1}} \tag{2.1}
\end{equation*}
$$

and

$$
\begin{equation*}
X_{j}(t, x)=x(t)-[x](t), \quad x \in C[0, T] \tag{2.2}
\end{equation*}
$$

for each $j=1, \ldots, n+1$.
The following theorem gives an interesting observation for the process $x(t)-[x](t)$ on $[0, T] \times C[0, T]$. In fact, $x(t)-[x](t)$ is a Brownian bridge motion on each subinterval and the detailed proof is given as in Theorem 2.4 of [5].

Theorem 2.1. For each $j=1, \ldots, n+1$, let $X_{j}$ be given by (2.2). Then, $X_{j}$ is a Brownian bridge motion process on $\left[t_{j-1}, t_{j}\right]$. Moreover, for $t \in\left(t_{j-1}, t_{j}\right), X_{j}(t, \cdot)$ is normally distributed with mean 0 and variance $\Gamma_{j}(t)$ which is given by (2.1).

Using Theorem 2.1, we can prove the following theorem which plays the key role in deriving the desired simple formula. We emphasize that the proof of the theorem is different from Theorem 1 of [9].

Theorem $2.2\left(\left[5\right.\right.$, Theorem 2.6]). Let $Y_{n+1}: C[0, T] \rightarrow \mathbb{R}^{n+2}$ be given by

$$
Y_{n+1}(x)=\left(x\left(t_{0}\right), x\left(t_{1}\right)-x\left(t_{0}\right), \ldots, x\left(t_{n+1}\right)-x\left(t_{0}\right)\right) .
$$

Then the processes $\{x(t)-[x](t): 0 \leqslant t \leqslant T\}$ and $Y_{n+1}$ are stochastically independent.

Using Theorem 2.2, we can prove the following theorem. The detailed proof is given as in Theorem 2.8 of [5].

Theorem 2.3. Let $X_{n+1}: C[0, T] \rightarrow \mathbb{R}^{n+2}$ be given by

$$
\begin{equation*}
X_{n+1}(x)=\left(x\left(t_{0}\right), x\left(t_{1}\right), \ldots, x\left(t_{n+1}\right)\right) \tag{2.3}
\end{equation*}
$$

Then the processes $\{x(t)-[x](t): 0 \leqslant t \leqslant T\}$ and $X_{n+1}$ are stochastically independent.

Applying the same method used in the proof of Theorem 2 of [9] with an aid of Problem 4 in [1, p. 216], we have the following theorem from Theorem 2.3.

Theorem 2.4. Let $F: C[0, T] \rightarrow \mathbb{C}$ be integrable and $X_{n+1}$ be given by (2.3) of Theorem 2.3. Then for a Borel subset $B$ of $\mathbb{R}^{n+2}$ we have

$$
\int_{X_{n+1}^{-1}(B)} F(x) \mathrm{d} w_{\varphi}(x)=\int_{B} E\left[F\left(x-[x]+\left[\vec{\xi}_{n+1}\right]\right)\right] \mathrm{d} P_{X_{n+1}}\left(\vec{\xi}_{n+1}\right)
$$

where $P_{X_{n+1}}$ is the probability distribution of $X_{n+1}$ on $\left(\mathbb{R}^{n+2}, \mathscr{B}\left(\mathbb{R}^{n+2}\right)\right)$. Moreover, by the definition of the conditional $w_{\varphi}$-integral, we have for $P_{X_{n+1}}$-a.e. $\vec{\xi}_{n+1} \in \mathbb{R}^{n+2}$

$$
\begin{equation*}
E\left[F \mid X_{n+1}\right]\left(\vec{\xi}_{n+1}\right)=E\left[F\left(x-[x]+\left[\vec{\xi}_{n+1}\right]\right)\right] . \tag{2.4}
\end{equation*}
$$

Note that both $[x]\left(t_{0}\right)=x\left(t_{0}\right)$ and $\left[\vec{\xi}_{n+1}\right]\left(t_{0}\right)=\xi_{0}$ need not be 0 in Theorem 2.4. In the following theorem, we derive the desired simple formula by removing the component $x\left(t_{n+1}\right)$ in the conditioning function $X_{n+1}$ given by (2.3).

Theorem 2.5. Let $X_{n}: C[0, T] \rightarrow \mathbb{R}^{n+1}$ be given by

$$
\begin{equation*}
X_{n}(x)=\left(x\left(t_{0}\right), x\left(t_{1}\right), \ldots, x\left(t_{n}\right)\right) \tag{2.5}
\end{equation*}
$$

and $X_{n+1}$ by (2.3). Moreover let $F$ be defined and integrable on $C[0, T]$ and $P_{X_{n}}$ be a probability distribution of $X_{n}$ on $\left(\mathbb{R}^{n+1}, \mathscr{B}\left(\mathbb{R}^{n+1}\right)\right)$. Then for any Borel subset $B$ of $\mathbb{R}^{n+1}$, we have

$$
\begin{aligned}
\int_{X_{n}^{-1}(B)} F(x) \mathrm{d} w_{\varphi}(x)=[ & \left.\frac{1}{2 \pi\left(T-t_{n}\right)}\right]^{1 / 2} \int_{B} \int_{\mathbb{R}} E\left[F\left(x-[x]+\left[\vec{\xi}_{n+1}\right]\right)\right] \\
& \times \exp \left\{-\frac{\left(\xi_{n+1}-\xi_{n}\right)^{2}}{2\left(T-t_{n}\right)}\right\} \mathrm{d} \xi_{n+1} \mathrm{~d} P_{X_{n}}\left(\vec{\xi}_{n}\right)
\end{aligned}
$$

where $\vec{\xi}_{n}=\left(\xi_{0}, \xi_{1}, \ldots, \xi_{n}\right)$ and $\vec{\xi}_{n+1}=\left(\xi_{0}, \xi_{1}, \ldots, \xi_{n}, \xi_{n+1}\right)$. Hence we have by Theorem 2.4 and the definition of the conditional $w_{\varphi}$-integral

$$
\begin{align*}
& E\left[F \mid X_{n}\right]\left(\vec{\xi}_{n}\right)  \tag{2.6}\\
& \quad=\left[\frac{1}{2 \pi\left(T-t_{n}\right)}\right]^{1 / 2} \int_{\mathbb{R}} E\left[F\left(x-[x]+\left[\vec{\xi}_{n+1}\right]\right)\right] \exp \left\{-\frac{\left(\xi_{n+1}-\xi_{n}\right)^{2}}{2\left(T-t_{n}\right)}\right\} \mathrm{d} \xi_{n+1} \\
& \quad=\left[\frac{1}{2 \pi\left(T-t_{n}\right)}\right]^{1 / 2} \int_{\mathbb{R}} E\left[F \mid X_{n+1}\right]\left(\vec{\xi}_{n+1}\right) \exp \left\{-\frac{\left(\xi_{n+1}-\xi_{n}\right)^{2}}{2\left(T-t_{n}\right)}\right\} \mathrm{d} \xi_{n+1}
\end{align*}
$$

for $P_{X_{n}}$-a.e. $\vec{\xi}_{n} \in \mathbb{R}^{n+1}$.
Proof. Let $P_{X_{n+1}}$ be the probability distribution of $X_{n+1}$ on $\left(\mathbb{R}^{n+2}, \mathscr{B}\left(\mathbb{R}^{n+2}\right)\right)$. Then for any Borel subset $B$ of $\mathbb{R}^{n+1}$, we have $X_{n}^{-1}(B)=X_{n+1}^{-1}(B \times \mathbb{R})$ so that we also have by Theorem 2.4

$$
\begin{aligned}
\int_{X_{n}^{-1}(B)} F(x) \mathrm{d} w_{\varphi}(x) & =\int_{X_{n+1}^{-1}(B \times \mathbb{R})} F(x) \mathrm{d} w_{\varphi}(x) \\
& =\int_{B \times \mathbb{R}} E\left[F \mid X_{n+1}\right]\left(\vec{\xi}_{n+1}\right) \mathrm{d} P_{X_{n+1}}\left(\vec{\xi}_{n+1}\right) \\
& =\int_{B \times \mathbb{R}} E\left[F\left(x-[x]+\left[\vec{\xi}_{n+1}\right]\right)\right] \mathrm{d} P_{X_{n+1}}\left(\vec{\xi}_{n+1}\right)
\end{aligned}
$$

By Theorem 1.1 and Fubini's theorem, we have

$$
\begin{aligned}
& \int_{X_{n}^{-1}(B)} F(x) \mathrm{d} w_{\varphi}(x)= \int_{\mathbb{R}} \int_{\mathbb{R}^{n}} \chi_{B}\left(\vec{\xi}_{n}\right)\left[\int_{\mathbb{R}}\right. \\
& E[ \left.F\left(x-[x]+\left[\vec{\xi}_{n+1}\right]\right)\right] W_{n+1}\left(\left(t_{0}, \ldots, t_{n+1}\right) ;\right. \\
&\left.\left.\xi_{0}, \ldots, \xi_{n}, \xi_{n+1}\right) \mathrm{~d} \xi_{n+1}\right] \mathrm{d}\left(\xi_{1}, \ldots, \xi_{n}\right) \mathrm{d} \varphi\left(\xi_{0}\right) \\
&=\left[\frac{1}{2 \pi\left(T-t_{n}\right)}\right]^{1 / 2} \int_{B} \int_{\mathbb{R}} E\left[F\left(x-[x]+\left[\vec{\xi}_{n+1}\right]\right)\right] \\
& \times \exp \left\{-\frac{\left(\xi_{n+1}-\xi_{n}\right)^{2}}{2\left(T-t_{n}\right)}\right\} \mathrm{d} \xi_{n+1} \mathrm{~d} P_{X_{n}}\left(\vec{\xi}_{n}\right)
\end{aligned}
$$

where $\chi_{B}$ denotes the indicator function of $B$ and $W_{n+1}$ is given by (1.4) replacing $n$ by $n+1$. Now, the proof is completed.

For a function $F: C[0, T] \rightarrow \mathbb{C}$ and $\lambda>0$, let $F^{\lambda}(x)=F\left(\lambda^{-1 / 2} x\right)$ and $X_{n+1}^{\lambda}(x)=$ $X_{n+1}\left(\lambda^{-1 / 2} x\right), X_{n}^{\lambda}(x)=X_{n}\left(\lambda^{-1 / 2} x\right)$, where $X_{n+1}$ and $X_{n}$ are given by (2.3) and (2.5), respectively. Suppose that $E\left[F^{\lambda}\right]$ exists for each $\lambda>0$. By the definition of conditional $w_{\varphi}$-integral and (2.4), we have

$$
E\left[F^{\lambda} \mid X_{n+1}^{\lambda}\right]\left(\vec{\xi}_{n+1}\right)=E\left[F\left(\lambda^{-1 / 2}(x-[x])+\left[\vec{\xi}_{n+1}\right]\right)\right]
$$

for $P_{X_{n+1}^{\lambda}}$-a.e. $\vec{\xi}_{n+1}=\left(\xi_{0}, \xi_{1}, \ldots, \xi_{n}, \xi_{n+1}\right) \in \mathbb{R}^{n+2}$, where $P_{X_{n+1}^{\lambda}}$ is the probability distribution of $X_{n+1}^{\lambda}$ on $\left(\mathbb{R}^{n+2}, \mathscr{B}\left(\mathbb{R}^{n+2}\right)\right)$. For $\vec{\xi}_{n}=\left(\xi_{0}, \xi_{1}, \ldots, \xi_{n}\right) \in \mathbb{R}^{n+1}$ and $\xi_{n+1} \in \mathbb{R}$, let $\vec{\xi}_{n+1}^{\lambda}=\left(\lambda^{1 / 2} \xi_{0}, \lambda^{1 / 2} \xi_{1}, \ldots, \lambda^{1 / 2} \xi_{n}, \xi_{n+1}\right)$. Then we have by (2.6) and the change of variable theorem

$$
\begin{align*}
E\left[F^{\lambda} \mid X_{n}^{\lambda}\right]\left(\vec{\xi}_{n}\right)=\left[\frac{1}{2 \pi\left(T-t_{n}\right)}\right]^{1 / 2} & \int_{\mathbb{R}} E\left[F^{\lambda}\left(x-[x]+\left[\vec{\xi}_{n+1}^{\lambda}\right]\right)\right]  \tag{2.7}\\
& \times \exp \left\{-\frac{\left(\xi_{n+1}-\lambda^{1 / 2} \xi_{n}\right)^{2}}{2\left(T-t_{n}\right)}\right\} \mathrm{d} \xi_{n+1} \\
=\left[\frac{\lambda}{2 \pi\left(T-t_{n}\right)}\right]^{1 / 2} & \int_{\mathbb{R}} E\left[F\left(\lambda^{-1 / 2}(x-[x])+\left[\vec{\xi}_{n+1}\right]\right)\right] \\
& \times \exp \left\{-\frac{\lambda\left(\xi_{n+1}-\xi_{n}\right)^{2}}{2\left(T-t_{n}\right)}\right\} \mathrm{d} \xi_{n+1}
\end{align*}
$$

for $P_{X_{n}^{\lambda}}$-a.e. $\vec{\xi}_{n}$, where $P_{X_{n,}^{\lambda}}$ is the probability distribution of $X_{n}^{\lambda}$ on $\left(\mathbb{R}^{n+1}, \mathscr{B}\left(\mathbb{R}^{n+1}\right)\right)$. If $E\left[F\left(\lambda^{-1 / 2}(x-[x])+\left[\vec{\xi}_{n+1}\right]\right)\right]$ has the analytic extension $J_{\lambda}^{*}(F)\left(\vec{\xi}_{n+1}\right)$ on $\mathbb{C}_{+}$as a function of $\lambda$, then it is called the conditional analytic Wiener $w_{\varphi}$-integral of $F$ given $X_{n+1}$ with parameter $\lambda$ and denoted by

$$
E^{a n w_{\lambda}}\left[F \mid X_{n+1}\right]\left(\vec{\xi}_{n+1}\right)=J_{\lambda}^{*}(F)\left(\vec{\xi}_{n+1}\right)
$$

for $\vec{\xi}_{n+1} \in \mathbb{R}^{n+2}$. Moreover, if for a non-zero real $q, E^{a n w_{\lambda}}\left[F \mid X_{n+1}\right]\left(\vec{\xi}_{n+1}\right)$ has a limit as $\lambda$ approaches to $-i q$ through $\mathbb{C}_{+}$, then it is called the conditional analytic Feynman $w_{\varphi}$-integral of $F$ given $X_{n+1}$ with parameter $q$ and denoted by

$$
E^{a n f_{q}}\left[F \mid X_{n+1}\right]\left(\vec{\xi}_{n+1}\right)=\lim _{\lambda \rightarrow-i q} E^{a n w_{\lambda}}\left[F \mid X_{n+1}\right]\left(\vec{\xi}_{n+1}\right)
$$

Similar definitions are understood with (2.7) if we replace $X_{n+1}$ by $X_{n}$.

## 3. Evaluations of conditional $w_{\varphi}$-Integrals

Throughout the remainder of this paper, let $X_{n+1}$ and $X_{n}$ be given by (2.3) and (2.5), respectively. Moreover, let $P_{X_{n+1}}$ and $P_{X_{n}}$ denote the probability distributions of $X_{n+1}$ and $X_{n}$ on the Borel $\sigma$-algebras of $\mathbb{R}^{n+2}$ and $\mathbb{R}^{n+1}$, respectively.

We now evaluate the conditional $w_{\varphi}$-integrals of the functions on $C[0, T]$ as applications of (2.4). For this purpose, we modify the result of [5, Theorem 3.1] in the following theorem.

Theorem 3.1. Let $F_{m}(x)=\int_{0}^{T}(x(t))^{m} \mathrm{~d} t(m \in \mathbb{N})$ for $x \in C[0, T]$ and suppose that $\int_{\mathbb{R}}|u|^{m} \mathrm{~d} \varphi(u)<\infty$. Then $F_{m}$ is $w_{\varphi}$-integrable. Moreover, $E\left[F_{m} \mid X_{n+1}\right]\left(\vec{\xi}_{n+1}\right)$ exists for $P_{X_{n+1}}$-a.e. $\vec{\xi}_{n+1}=\left(\xi_{0}, \xi_{1}, \ldots, \xi_{n}, \xi_{n+1}\right) \in \mathbb{R}^{n+2}$ and it is given by

$$
E\left[F_{m} \mid X_{n+1}\right]\left(\vec{\xi}_{n+1}\right)=\sum_{j=1}^{n+1} \sum_{k=0}^{\left[\frac{m}{2}\right]} \sum_{l=0}^{m-2 k} \frac{m!(l+k)!\left(t_{j}-t_{j-1}\right)^{k+1} \xi_{j-1}^{m-2 k-l}\left(\xi_{j}-\xi_{j-1}\right)^{l}}{2^{k} l!(m-2 k-l)!(l+2 k+1)!}
$$

where [ $\cdot]$ denotes the greatest integer function.
Proof. Using Theorem 2.4 directly or by Theorem 3.1 in [5], we can prove for $P_{X_{n+1}}$-a.e. $\vec{\xi}_{n+1} \in \mathbb{R}^{n+2}$

$$
\begin{align*}
& E\left[F_{m} \mid X_{n+1}\right]\left(\vec{\xi}_{n+1}\right)=\sum_{j=1}^{n+1} \sum_{k=0}^{\left[\frac{m}{2}\right]} \frac{m!}{2^{k} k!(m-2 k)!}  \tag{3.1}\\
& \times \int_{t_{j-1}}^{t_{j}}\left(\left[\vec{\xi}_{n+1}\right](t)\right)^{m-2 k}\left(\Gamma_{j}(t)\right)^{k} \mathrm{~d} t
\end{align*}
$$

where $\Gamma_{j}(t)$ is given by (2.1). For $j=1, \ldots, n+1$ and $k=0, \ldots,\left[\frac{m}{2}\right]$, we have

$$
\begin{aligned}
& \int_{t_{j-1}}^{t_{j}}\left(\left[\vec{\xi}_{n+1}\right](t)\right)^{m-2 k}\left(\Gamma_{j}(t)\right)^{k} \mathrm{~d} t \\
& \quad=\int_{t_{j-1}}^{t_{j}}\left(\frac{\xi_{j}-\xi_{j-1}}{t_{j}-t_{j-1}}\left(t-t_{j-1}\right)+\xi_{j-1}\right)^{m-2 k}\left(\frac{\left(t_{j}-t\right)\left(t-t_{j-1}\right)}{t_{j}-t_{j-1}}\right)^{k} \mathrm{~d} t \\
& \quad=\sum_{l=0}^{m-2 k}\binom{m-2 k}{l}\left(t_{j}-t_{j-1}\right)^{-l-k}\left(\xi_{j}-\xi_{j-1}\right)^{l} \xi_{j-1}^{m-2 k-l} \\
& \quad \times \int_{t_{j-1}}^{t_{j}}\left(t_{j}-t\right)^{k}\left(t-t_{j-1}\right)^{l+k} \mathrm{~d} t
\end{aligned}
$$

by the binomial expansion. For $l=0, \ldots, m-2 k$, we now have by repeated applications of the integration by parts formula

$$
\begin{aligned}
& \int_{t_{j-1}}^{t_{j}}\left(t_{j}-t\right)^{k}\left(t-t_{j-1}\right)^{l+k} \mathrm{~d} t \\
&=\frac{k}{l+k+1} \int_{t_{j-1}}^{t_{j}}\left(t_{j}-t\right)^{k-1}\left(t-t_{j-1}\right)^{l+k+1} \mathrm{~d} t \\
& \vdots \\
&=\frac{k!}{(l+k+1)(l+k+2) \ldots(l+2 k)} \int_{t_{j-1}}^{t_{j}}\left(t-t_{j-1}\right)^{l+2 k} \mathrm{~d} t \\
&=\frac{k!}{(l+k+1)(l+k+2) \ldots(l+2 k)(l+2 k+1)}\left(t_{j}-t_{j-1}\right)^{l+2 k+1}
\end{aligned}
$$

so that we have

$$
\begin{aligned}
& E\left[F_{m} \mid X_{n+1}\right]\left(\vec{\xi}_{n+1}\right) \\
& =\sum_{j=1}^{n+1} \sum_{k=0}^{\left[\frac{m}{2}\right]} \frac{m!}{2^{k} k!(m-2 k)!} \sum_{l=0}^{m-2 k}\binom{m-2 k}{l}\left(t_{j}-t_{j-1}\right)^{-l-k}\left(\xi_{j}-\xi_{j-1}\right)^{l} \xi_{j-1}^{m-2 k-l} \\
& \quad \times \frac{k!\left(t_{j}-t_{j-1}\right)^{l+2 k+1}}{(l+k+1)(l+k+2) \ldots(l+2 k)(l+2 k+1)} \\
& =\sum_{j=1}^{n+1} \sum_{k=0}^{\left[\frac{m}{2}\right]} \sum_{l=0}^{m-2 k} \frac{m!(l+k)!\left(t_{j}-t_{j-1}\right)^{k+1} \xi_{j-1}^{m-2 k-l}\left(\xi_{j}-\xi_{j-1}\right)^{l}}{2^{k} l!(m-2 k-l)!(l+2 k+1)!}
\end{aligned}
$$

which is the desired result.
In the following example, we evaluate $E\left[F_{m} \mid X_{n+1}\right](m=1,2,3)$ as special cases of Theorem 3.1.

Example 3.1. For $m=1,2,3$, let $F_{m}(x)=\int_{0}^{T}(x(t))^{m} \mathrm{~d} t$ for $x \in C[0, T]$ and suppose that $\int_{\mathbb{R}}|u|^{m} \mathrm{~d} \varphi(u)<\infty$. Then for $P_{X_{n+1}}$-a.e. $\vec{\xi}_{n+1}=\left(\xi_{0}, \xi_{1}, \ldots, \xi_{n}, \xi_{n+1}\right) \in$ $\mathbb{R}^{n+2}$, we have by Theorem 3.1

$$
E\left[F_{1} \mid X_{n+1}\right]\left(\vec{\xi}_{n+1}\right)=\frac{1}{2} \sum_{j=1}^{n+1}\left(t_{j}-t_{j-1}\right)\left(\xi_{j}+\xi_{j-1}\right)
$$

which can be also obtained by an application of Corollary 4.5 in [7]. We also have

$$
E\left[F_{2} \mid X_{n+1}\right]\left(\vec{\xi}_{n+1}\right)=\frac{1}{6} \sum_{j=1}^{n+1}\left(t_{j}-t_{j-1}\right)\left(t_{j}-t_{j-1}+2 \xi_{j}^{2}+2 \xi_{j} \xi_{j-1}+2 \xi_{j-1}^{2}\right)
$$

which is the result given by Corollary 4.10 of [7]. Moreover we have

$$
\begin{aligned}
& E\left[F_{3} \mid X_{n+1}\right]\left(\vec{\xi}_{n+1}\right) \\
& \quad=\frac{1}{4} \sum_{j=1}^{n+1}\left(t_{j}-t_{j-1}\right)\left[\left(t_{j}-t_{j-1}\right)\left(\xi_{j}+\xi_{j-1}\right)+\xi_{j}^{3}+\xi_{j}^{2} \xi_{j-1}+\xi_{j} \xi_{j-1}^{2}+\xi_{j-1}^{3}\right]
\end{aligned}
$$

Remark 3.1. The results of Example 3.1 are also given by Example 3.3 in [5]. We emphasize that the evaluations of Example 3.1 depend on Theorem 3.1, but the evaluations of Example 3.3 in [5] depend on (3.1).

Now we evaluate the conditional $w_{\varphi}$-integral $E\left[F_{m} \mid X_{n}\right]$ of $F_{m}$ which is given as in Theorem 3.1.

Theorem 3.2. Under the conditions and notations given as in Theorem 3.1, we have for $P_{X_{n}}$-a.e. $\vec{\xi}_{n}=\left(\xi_{0}, \xi_{1}, \ldots, \xi_{n}\right) \in \mathbb{R}^{n+1}$

$$
\begin{aligned}
E\left[F_{m} \mid X_{n}\right]\left(\vec{\xi}_{n}\right)= & \sum_{j=1}^{n} \sum_{k=0}^{\left[\frac{m}{2}\right]} \sum_{l=0}^{m-2 k} \frac{m!(l+k)!\left(t_{j}-t_{j-1}\right)^{k+1} \xi_{j-1}^{m-2 k-l}\left(\xi_{j}-\xi_{j-1}\right)^{l}}{2^{k} l!(m-2 k-l)!(l+2 k+1)!} \\
& +\sum_{k=0}^{\left[\frac{m}{2}\right]} \sum_{l=0}^{\left[\frac{m-2 k}{2}\right]} \frac{m!(2 l+k)!\xi_{n}^{m-2 k-2 l}\left(T-t_{n}\right)^{l+k+1}}{2^{l+k} l!(m-2 k-2 l)!(2 l+2 k+1)!}
\end{aligned}
$$

Proof. For convenience let

$$
K=\sum_{j=1}^{n} \sum_{k=0}^{\left[\frac{m}{2}\right]} \sum_{l=0}^{m-2 k} \frac{m!(l+k)!\left(t_{j}-t_{j-1}\right)^{k+1} \xi_{j-1}^{m-2 k-l}\left(\xi_{j}-\xi_{j-1}\right)^{l}}{2^{k} l!(m-2 k-l)!(l+2 k+1)!}
$$

By Theorems 2.5 and 3.1, we have

$$
\begin{aligned}
E\left[F_{m} \mid X_{n}\right]\left(\vec{\xi}_{n}\right)= & {\left[\frac{1}{2 \pi\left(T-t_{n}\right)}\right]^{1 / 2} \int_{\mathbb{R}} E\left[F_{m}\left(x-[x]+\left[\vec{\xi}_{n+1}\right]\right)\right] } \\
& \quad \times \exp \left\{-\frac{\left(\xi_{n+1}-\xi_{n}\right)^{2}}{2\left(T-t_{n}\right)}\right\} \mathrm{d} \xi_{n+1} \\
= & K+\sum_{k=0}^{\left[\frac{m}{2}\right]} \sum_{l=0}^{m-2 k} \frac{m!(l+k)!\left(T-t_{n}\right)^{k+1} \xi_{n}^{m-2 k-l}}{2^{k} l!(m-2 k-l)!(l+2 k+1)!} \\
& \times\left[\frac{1}{2 \pi\left(T-t_{n}\right)}\right]^{1 / 2} \int_{\mathbb{R}}\left(\xi_{n+1}-\xi_{n}\right)^{l} \exp \left\{-\frac{\left(\xi_{n+1}-\xi_{n}\right)^{2}}{2\left(T-t_{n}\right)}\right\} \mathrm{d} \xi_{n+1}
\end{aligned}
$$

where $\vec{\xi}_{n+1}=\left(\xi_{0}, \xi_{1}, \ldots, \xi_{n}, \xi_{n+1}\right)$. Let $v=\xi_{n+1}-\xi_{n}$. By the change of variable theorem, we have

$$
\begin{aligned}
E\left[F_{m} \mid X_{n}\right]\left(\vec{\xi}_{n}\right)= & K+\sum_{k=0}^{\left[\frac{m}{2}\right]} \sum_{l=0}^{m-2 k} \frac{m!(l+k)!\left(T-t_{n}\right)^{k+1}}{2^{k} l!(m-2 k-l)!(l+2 k+1)!} \\
& \times \xi_{n}^{m-2 k-l}\left[\frac{1}{2 \pi\left(T-t_{n}\right)}\right]^{1 / 2} \int_{\mathbb{R}} v^{l} \exp \left\{-\frac{v^{2}}{2\left(T-t_{n}\right)}\right\} \mathrm{d} v \\
= & K+2 \sum_{k=0}^{\left[\frac{m}{2}\right]} \sum_{l=0}^{\left.\frac{m-2 k}{2}\right]} \frac{m!(2 l+k)!\left(T-t_{n}\right)^{k+1}}{2^{k}(2 l)!(m-2 k-2 l)!(2 l+2 k+1)!} \\
& \times \xi_{n}^{m-2 k-2 l}\left[\frac{1}{2 \pi\left(T-t_{n}\right)}\right]^{1 / 2} \int_{0}^{\infty} v^{2 l} \exp \left\{-\frac{v^{2}}{2\left(T-t_{n}\right)}\right\} \mathrm{d} v
\end{aligned}
$$

replacing $l$ by $2 l$. Let $u=\frac{1}{2} v^{2} /\left(T-t_{n}\right)$. Again, we have by the change of variable theorem

$$
\begin{aligned}
E\left[F_{m} \mid X_{n}\right]\left(\vec{\xi}_{n}\right)= & K+\sum_{k=0}^{\left[\frac{m}{2}\right]} \sum_{l=0}^{\left[\frac{m-2 k}{2}\right]} \frac{m!(2 l+k)!\left(T-t_{n}\right)^{k+1}}{2^{k}(2 l)!(m-2 k-2 l)!(2 l+2 k+1)!} \\
& \times \xi_{n}^{m-2 k-2 l} 2^{l}\left(T-t_{n}\right)^{l}\left(\frac{1}{\pi}\right)^{1 / 2} \int_{0}^{\infty} u^{(2 l+1) / 2-1} \exp \{-u\} \mathrm{d} u \\
= & K+\sum_{k=0}^{\left[\frac{m}{2}\right]} \sum_{l=0}^{\left[\frac{m-2 k}{2}\right]} \frac{2^{l} m!(2 l+k)!}{2^{k}(2 l)!(m-2 k-2 l)!(2 l+2 k+1)!} \\
& \times\left(T-t_{n}\right)^{l+k+1} \xi_{n}^{m-2 k-2 l}\left(\frac{1}{\pi}\right)^{1 / 2} \Gamma\left(\frac{2 l+1}{2}\right) \\
= & K+\sum_{k=0}^{\left[\frac{m}{2}\right]} \sum_{l=0}^{\left[\frac{m-2 k}{2}\right]} \frac{m!(2 l+k)!\left(T-t_{n}\right)^{l+k+1} \xi_{n}^{m-2 k-2 l}}{2^{k+l} l!(m-2 k-2 l)!(2 l+2 k+1)!}
\end{aligned}
$$

where $\Gamma$ denotes the gamma function. Now the proof is completed.
In the following example, we evaluate $E\left[F_{m} \mid X_{n}\right](m=1,2,3)$ as applications of Theorem 3.2.

Example 3.2. For $m=1,2,3$, let $F_{m}(x)=\int_{0}^{T}(x(t))^{m} \mathrm{~d} t$ for $x \in C[0, T]$ and suppose that $\int_{\mathbb{R}}|u|^{m} \mathrm{~d} \varphi(u)<\infty$. Moreover, let $Z_{1}(x)=T^{-1} F_{1}(x)$ and $Z_{2}(x)=$ $\sum_{j=1}^{n+1}\left(t_{j}-t_{j-1}\right)^{-1} \int_{t_{j-1}}^{t_{j}} x(t) \mathrm{d} t$ for $x \in C[0, T]$. Then for $P_{X_{n}}$-a.e. $\vec{\xi}_{n}=\left(\xi_{0}, \xi_{1}, \ldots, \xi_{n}\right) \in$ $\mathbb{R}^{n+1}$, we have

$$
E\left[F_{1} \mid X_{n}\right]\left(\vec{\xi}_{n}\right)=\frac{1}{2} \sum_{j=1}^{n}\left(t_{j}-t_{j-1}\right)\left(\xi_{j}+\xi_{j-1}\right)+\left(T-t_{n}\right) \xi_{n}
$$

Hence we have

$$
E\left[Z_{1} \mid X_{n}\right]\left(\vec{\xi}_{n}\right)=\frac{1}{2 T} \sum_{j=1}^{n}\left(t_{j}-t_{j-1}\right)\left(\xi_{j}+\xi_{j-1}\right)+\frac{1}{T}\left(T-t_{n}\right) \xi_{n}
$$

and

$$
E\left[Z_{2} \mid X_{n}\right]\left(\vec{\xi}_{n}\right)=\frac{1}{2} \sum_{j=1}^{n}\left(\xi_{j}+\xi_{j-1}\right)+\xi_{n}
$$

which are also given by Theorems 4.3 and 4.6 in [7], respectively. Further, we have

$$
\begin{aligned}
E\left[F_{2} \mid X_{n}\right]\left(\vec{\xi}_{n}\right)= & \frac{1}{6} \sum_{j=1}^{n}\left(t_{j}-t_{j-1}\right)\left(t_{j}-t_{j-1}+2 \xi_{j}^{2}+2 \xi_{j} \xi_{j-1}+2 \xi_{j-1}^{2}\right) \\
& +\left(T-t_{n}\right) \xi_{n}^{2}+\frac{1}{2}\left(T-t_{n}\right)^{2}
\end{aligned}
$$

which is also given by Theorem 4.8 in [7]. Finally, we have

$$
\begin{aligned}
E\left[F_{3} \mid X_{n}\right]\left(\vec{\xi}_{n}\right)= & \frac{1}{4} \sum_{j=1}^{n}\left(t_{j}-t_{j-1}\right)\left[\left(t_{j}-t_{j-1}\right)\left(\xi_{j}+\xi_{j-1}\right)+\xi_{j}^{3}+\xi_{j}^{2} \xi_{j-1}+\xi_{j} \xi_{j-1}^{2}+\xi_{j-1}^{3}\right] \\
& +\sum_{k=0}^{1} \sum_{l=0}^{\left[\frac{3-2 k}{2}\right]} \frac{3!(2 l+k)!\left(T-t_{n}\right)^{l+k+1} \xi_{n}^{3-2 k-2 l}}{2^{k+l} l!(3-2 k-2 l)!(2 l+2 k+1)!} \\
= & \frac{1}{4} \sum_{j=1}^{n}\left(t_{j}-t_{j-1}\right)\left[\left(t_{j}-t_{j-1}\right)\left(\xi_{j}+\xi_{j-1}\right)+\xi_{j}^{3}+\xi_{j}^{2} \xi_{j-1}+\xi_{j} \xi_{j-1}^{2}+\xi_{j-1}^{3}\right] \\
& +\left(T-t_{n}\right) \xi_{n}^{3}+\frac{3}{2}\left(T-t_{n}\right)^{2} \xi_{n} .
\end{aligned}
$$

Now, we generalize the result of Example 4 in [9], which is also considered by Chang and Chang ([4]).

Theorem 3.3. Let $F(x)=\exp \left\{\int_{0}^{T} x(t) \mathrm{d} t\right\}$ for $x \in C[0, T]$. Then, for a.e. $y \in C[0, T]$, we have

$$
\lim _{\|\tau\| \rightarrow 0} E\left[F(x) \mid x\left(t_{0}\right)=y\left(t_{0}\right), x\left(t_{1}\right)=y\left(t_{1}\right), \ldots, x\left(t_{n}\right)=y\left(t_{n}\right)\right]=F(y)
$$

where $\tau: 0=t_{0}<t_{1}<\ldots<t_{n}<t_{n+1}=T$ is any partition of the interval [0,T].
Proof. For a.e. $y \in C[0, T]$, we have by Theorem 2.5

$$
\begin{aligned}
& E\left[F(x) \mid x\left(t_{0}\right)=y\left(t_{0}\right), x\left(t_{1}\right)=y\left(t_{1}\right), \ldots, x\left(t_{n}\right)=y\left(t_{n}\right)\right] \\
& \quad=\exp \left\{\frac{1}{2} \sum_{j=1}^{n}\left(t_{j}-t_{j-1}\right)\left(y\left(t_{j-1}\right)+y\left(t_{j}\right)\right)\right\} \int_{C} \exp \left\{\int_{0}^{T}(x(t)-[x](t)) \mathrm{d} t\right\} \mathrm{d} w_{\varphi}(x) \\
& \quad \times\left[\frac{1}{2 \pi\left(T-t_{n}\right)}\right]^{1 / 2} \int_{\mathbb{R}} \exp \left\{\frac{1}{2}\left(T-t_{n}\right)\left(y\left(t_{n}\right)+\xi_{n+1}\right)-\frac{\left(\xi_{n+1}-y\left(t_{n}\right)\right)^{2}}{2\left(T-t_{n}\right)}\right\} \mathrm{d} \xi_{n+1}
\end{aligned}
$$

where $[x]$ is the polygonal function of $x$ given by $\tau$. Then by the change of variable theorem, we have

$$
\begin{aligned}
E & {\left[F(x) \mid x\left(t_{0}\right)=y\left(t_{0}\right), x\left(t_{1}\right)=y\left(t_{1}\right), \ldots, x\left(t_{n}\right)=y\left(t_{n}\right)\right] } \\
= & \exp \left\{\frac{1}{2} \sum_{j=1}^{n}\left(t_{j}-t_{j-1}\right)\left(y\left(t_{j-1}\right)+y\left(t_{j}\right)\right)+\left(T-t_{n}\right) y\left(t_{n}\right)\right\} \\
& \times\left[\int_{C} \exp \left\{\int_{0}^{T}(x(t)-[x](t)) \mathrm{d} t\right\} \mathrm{d} w_{\varphi}(x)\right] \\
& \times\left[\left[\frac{1}{2 \pi\left(T-t_{n}\right)}\right]^{1 / 2} \int_{\mathbb{R}} \exp \left\{\frac{1}{2}\left(T-t_{n}\right) v-\frac{v^{2}}{2\left(T-t_{n}\right)}\right\} \mathrm{d} v\right] \\
= & \exp \left\{\frac{1}{2} \sum_{j=1}^{n}\left(t_{j}-t_{j-1}\right)\left(y\left(t_{j-1}\right)+y\left(t_{j}\right)\right)+\left(T-t_{n}\right) y\left(t_{n}\right)\right\} \exp \left\{\frac{\left(T-t_{n}\right)^{3}}{8}\right\} \\
& \times \int_{C} \exp \left\{\int_{0}^{T}(x(t)-[x](t)) \mathrm{d} t\right\} \mathrm{d} w_{\varphi}(x) .
\end{aligned}
$$

Letting $\|\tau\| \rightarrow 0$, we have the theorem because $\lim _{\|\tau\| \rightarrow 0}(x(t)-[x](t))=0$ for $x \in$ $C[0, T]$.

## 4. Translation theorems for conditional $w_{\varphi}$-Integrals

In this section, we derive a translation theorem for conditional $w_{\varphi}$-integrals, which is a generalization of Theorem 4 of [9].

Let $h \in L_{2}[0, T], \alpha \in \mathbb{R}$ and let $x_{0}(t)=\int_{0}^{t} h(s) \mathrm{d} s+\alpha$ for $0 \leqslant t \leqslant T$. Let $\varphi_{\alpha}$ be a measure on $(\mathbb{R}, \mathscr{B}(\mathbb{R}))$ such that $\varphi_{\alpha}(B)=\varphi(B+\alpha)$ for $B \in \mathscr{B}(\mathbb{R})$. Moreover, let $E_{w_{\varphi}}$ and $E_{w_{\varphi \alpha}}$ denote the conditional $w_{\varphi}$-integral and the conditional $w_{\varphi_{\alpha}}$-integral, respectively. The following theorems are translation theorems for the conditional $w_{\varphi}$-integrals.

Theorem 4.1 ([5, Theorem 4.2]). Let $X_{n+1}$ be given by (2.3). Moreover, let $F$ be defined and $w_{\varphi}$-integrable on $C[0, T]$. Then we have for $P_{X_{n+1}}$-a.e. $\vec{\xi}_{n+1}=\left(\xi_{0}\right.$, $\left.\xi_{1}, \ldots, \xi_{n+1}\right) \in \mathbb{R}^{n+2}$

$$
\begin{aligned}
& E_{w_{\varphi}}\left[F \mid X_{n+1}\right]\left(\vec{\xi}_{n+1}\right) \\
& = \\
& \quad \exp \left\{\sum_{j=1}^{n+1} \frac{x_{0}\left(t_{j}\right)-x_{0}\left(t_{j-1}\right)}{t_{j}-t_{j-1}}\left[\left(\xi_{j}-\xi_{j-1}\right)-\frac{1}{2}\left(x_{0}\left(t_{j}\right)-x_{0}\left(t_{j-1}\right)\right)\right]\right\} \\
& \quad \times E_{w_{\varphi}}\left[F\left(x_{0}+\cdot\right) J \mid X_{n+1}\right]\left(\xi_{0}-x_{0}\left(t_{0}\right), \xi_{1}-x_{0}\left(t_{1}\right), \ldots, \xi_{n+1}-x_{0}\left(t_{n+1}\right)\right)
\end{aligned}
$$

where $t_{0}=0, t_{n+1}=T$ and $J(x)=\exp \left\{-\frac{1}{2}\left[\|h\|_{2}^{2}+2(h, x)\right]\right\}$ for $x \in C[0, T]$.

Theorem 4.2 ([7, Theorem 5.4]). Let $X: C[0, T] \rightarrow \mathbb{R}$ be defined by $X(x)=$ $x(T)$. Then, under the assumptions and notations given as in Theorem 4.1, we have for a.e. $\xi \in \mathbb{R}$

$$
\begin{aligned}
E_{w_{\varphi}}[F \mid X](\xi)= & E_{w_{\varphi}}\left[F\left(x_{0}+\cdot\right) J \mid X\right]\left(\xi-x_{0}(T)\right) \int_{\mathbb{R}} \exp \left\{-\frac{\left(\xi-x_{0}(T)-\xi_{0}\right)^{2}}{2 T}\right\} \mathrm{d} \varphi\left(\xi_{0}\right) \\
& \times\left[\int_{\mathbb{R}} \exp \left\{-\frac{\left(\xi-\xi_{0}\right)^{2}}{2 T}\right\} \mathrm{d} \varphi\left(\xi_{0}\right)\right]^{-1}
\end{aligned}
$$

Theorem 4.3. Let $X_{\tau}: C[0, T] \rightarrow \mathbb{R}$ be defined by $X_{\tau}(x)=\left(x\left(t_{0}\right), x(T)\right)$, where $t_{0}=0$. Then, under the assumptions and notations given as in Theorem 4.2, we have for a.e. $\xi \in \mathbb{R}$

$$
\begin{aligned}
E_{w_{\varphi}}[F \mid X](\xi)= & \left(\frac{1}{2 \pi T}\right)^{1 / 2} \int_{\mathbb{R}} \exp \left\{\frac{1}{T} \int_{0}^{T} h(s) \mathrm{d} s\left[\left(\xi-\xi_{0}\right)-\frac{1}{2} \int_{0}^{T} h(s) \mathrm{d} s\right]\right\} \\
& \times E_{w_{\varphi_{\alpha}}}\left[F\left(x_{0}+\cdot\right) J \mid X_{\tau}\right]\left(\xi_{0}-\alpha, \xi-x_{0}(T)\right) \exp \left\{-\frac{\left(\xi_{0}-\xi\right)^{2}}{2 T}\right\} \mathrm{d} \varphi\left(\xi_{0}\right) \\
= & E_{w_{\varphi}}\left[F\left(x_{0}+\cdot\right) J \mid X\right]\left(\xi-x_{0}(T)\right) \int_{\mathbb{R}} \exp \left\{-\frac{\left(\xi-x_{0}(T)-\xi_{0}\right)^{2}}{2 T}\right\} \mathrm{d} \varphi\left(\xi_{0}\right) \\
& \times\left[\int_{\mathbb{R}} \exp \left\{-\frac{\left(\xi-\xi_{0}\right)^{2}}{2 T}\right\} \mathrm{d} \varphi\left(\xi_{0}\right)\right]^{-1}
\end{aligned}
$$

Proof. For a Borel subset $B$ of $\mathbb{R}$, we have by Theorem 1.1 and Fubini's theorem

$$
\begin{aligned}
\int_{X^{-1}(B)} F(x) \mathrm{d} w_{\varphi}(x) & =\int_{X_{\tau}^{-1}(\mathbb{R} \times B)} F(x) \mathrm{d} w_{\varphi}(x)=\int_{\mathbb{R} \times B} E\left[F \mid X_{\tau}\right](\vec{\xi}) \mathrm{d} P_{X_{\tau}}(\vec{\xi}) \\
& =\left(\frac{1}{2 \pi T}\right)^{1 / 2} \int_{B} \int_{\mathbb{R}} E\left[F \mid X_{\tau}\right](\vec{\xi}) \exp \left\{-\frac{\left(\xi_{0}-\xi\right)^{2}}{2 T}\right\} \mathrm{d} \varphi\left(\xi_{0}\right) \mathrm{d} \xi
\end{aligned}
$$

where $\vec{\xi}=\left(\xi_{0}, \xi\right)$ and $P_{X_{\tau}}$ is the probability distribution of $X_{\tau}$ on $\left(\mathbb{R}^{2}, \mathscr{B}\left(\mathbb{R}^{2}\right)\right)$. By the definition of conditional expectation and Theorem 4.1, we also have for a.e. $\xi \in \mathbb{R}$

$$
\begin{aligned}
E_{w_{\varphi}}[F \mid X](\xi)= & \left(\frac{1}{2 \pi T}\right)^{1 / 2} \int_{\mathbb{R}} \exp \left\{\frac{1}{T} \int_{0}^{T} h(s) \mathrm{d} s\left[\left(\xi-\xi_{0}\right)-\frac{1}{2} \int_{0}^{T} h(s) \mathrm{d} s\right]\right\} \\
& \times E_{w_{\varphi_{\alpha}}}\left[F\left(x_{0}+\cdot\right) J \mid X_{\tau}\right]\left(\xi_{0}-\alpha, \xi-x_{0}(T)\right) \exp \left\{-\frac{\left(\xi_{0}-\xi\right)^{2}}{2 T}\right\} \mathrm{d} \varphi\left(\xi_{0}\right)
\end{aligned}
$$

which is the first equality in the theorem. The second equality in the theorem immediately follows from Theorem 4.2.

Combining Theorems 2.5 and 4.1, we have the following theorem.

Theorem 4.4. Let $X_{n}$ be given by (2.5). Under the assumptions and notations given as in Theorem 4.1, we have for $P_{X_{n}}$-a.e. $\vec{\xi}_{n}=\left(\xi_{0}, \xi_{1}, \ldots, \xi_{n}\right) \in \mathbb{R}^{n+1}$

$$
\begin{aligned}
& E_{w_{\varphi}}\left[F \mid X_{n}\right]\left(\vec{\xi}_{n}\right) \\
& =\left[\frac{1}{2 \pi\left(T-t_{n}\right)}\right]^{\frac{1}{2}} \exp \left\{\sum_{j=1}^{n} \frac{x_{0}\left(t_{j}\right)-x_{0}\left(t_{j-1}\right)}{t_{j}-t_{j-1}}\left[\left(\xi_{j}-\xi_{j-1}\right)-\frac{1}{2}\left(x_{0}\left(t_{j}\right)-x_{0}\left(t_{j-1}\right)\right)\right]\right\} \\
& \quad \times \int_{\mathbb{R}} E_{w_{\varphi_{\alpha}}}\left[F\left(x_{0}+\cdot\right) J \mid X_{n+1}\right]\left(\xi_{0}-x_{0}\left(t_{0}\right), \xi_{1}-x_{0}\left(t_{1}\right), \ldots,\right. \\
& \left.\quad \xi_{n}-x_{0}\left(t_{n}\right), \xi_{n}-x_{0}\left(t_{n}\right)+v\right) \exp \left\{-\frac{v^{2}}{2\left(T-t_{n}\right)}\right\} \mathrm{d} v .
\end{aligned}
$$

Proof. By Theorems 2.5 and 4.1, we have for $P_{X_{n}}$-a.e. $\vec{\xi}_{n} \in \mathbb{R}^{n+1}$

$$
\begin{aligned}
& E_{w_{\varphi}}\left[F \mid X_{n}\right]\left(\vec{\xi}_{n}\right) \\
& =\left[\frac{1}{2 \pi\left(T-t_{n}\right)}\right]^{\frac{1}{2}} \exp \left\{\sum_{j=1}^{n} \frac{\left(x_{0}\left(t_{j}\right)-x_{0}\left(t_{j-1}\right)\right)\left(\xi_{j}-\xi_{j-1}\right)}{t_{j}-t_{j-1}}-\sum_{j=1}^{n+1} \frac{\left(x_{0}\left(t_{j}\right)-x_{0}\left(t_{j-1}\right)\right)^{2}}{2\left(t_{j}-t_{j-1}\right)}\right\} \\
& \times \int_{\mathbb{R}} E_{w_{\varphi_{\alpha}}}\left[F\left(x_{0}+\cdot\right) J \mid X_{n+1}\right]\left(\xi_{0}-x_{0}\left(t_{0}\right), \xi_{1}-x_{0}\left(t_{1}\right), \ldots, \xi_{n}-x_{0}\left(t_{n}\right), \xi_{n+1}-x_{0}(T)\right) \\
& \quad \times \exp \left\{-\frac{\left(\xi_{n+1}-\xi_{n}\right)^{2}}{2\left(T-t_{n}\right)}+\frac{x_{0}(T)-x_{0}\left(t_{n}\right)}{T-t_{n}}\left(\xi_{n+1}-\xi_{n}\right)\right\} \mathrm{d} \xi_{n+1} \\
& =\left[\frac{1}{2 \pi\left(T-t_{n}\right)}\right]^{\frac{1}{2}} \exp \left\{\sum_{j=1}^{n} \frac{\left(x_{0}\left(t_{j}\right)-x_{0}\left(t_{j-1}\right)\right)}{t_{j}-t_{j-1}}\left[\left(\xi_{j}-\xi_{j-1}\right)-\frac{1}{2}\left(x_{0}\left(t_{j}\right)-x_{0}\left(t_{j-1}\right)\right)\right]\right\} \\
& \times \int_{\mathbb{R}} E_{w_{\varphi_{\alpha}}}\left[F\left(x_{0}+\cdot\right) J \mid X_{n+1}\right]\left(\xi_{0}-x_{0}\left(t_{0}\right), \xi_{1}-x_{0}\left(t_{1}\right), \ldots, \xi_{n}-x_{0}\left(t_{n}\right), \xi_{n+1}-x_{0}(T)\right) \\
& \quad \times \exp \left\{-\frac{\left[\left(\xi_{n+1}-\xi_{n}\right)-\left(x_{0}(T)-x_{0}\left(t_{n}\right)\right)\right]^{2}}{2\left(T-t_{n}\right)}\right\} \mathrm{d} \xi_{n+1}
\end{aligned}
$$

where $t_{n+1}=T$. Let $v=\left(\xi_{n+1}-\xi_{n}\right)-\left(x_{0}(T)-x_{0}\left(t_{n}\right)\right)$. Then by the change of variable theorem, we have the theorem as desired.

Letting $\alpha=0$ in the result of Theorem 4.4, we have the following corollary since $\varphi_{\alpha}=\varphi$.

Corollary 4.1. Under the assumptions and notations given as in Theorem 4.4 with one exception $\alpha=0$, we have $x_{0}(t)=\int_{0}^{t} h(s) \mathrm{d} s$ for $t \in[0, T]$ and $E_{w_{\varphi}}\left[F \mid X_{n}\right]\left(\vec{\xi}_{n}\right)$

$$
\begin{aligned}
& =\left[\frac{1}{2 \pi\left(T-t_{n}\right)}\right]^{\frac{1}{2}} \exp \left\{\sum_{j=1}^{n} \frac{\left(x_{0}\left(t_{j}\right)-x_{0}\left(t_{j-1}\right)\right)}{t_{j}-t_{j-1}}\left[\left(\xi_{j}-\xi_{j-1}\right)-\frac{1}{2}\left(x_{0}\left(t_{j}\right)-x_{0}\left(t_{j-1}\right)\right)\right]\right\} \\
& \times \int_{\mathbb{R}} E_{w_{\varphi}}\left[F\left(x_{0}+\cdot\right) J \mid X_{n+1}\right]\left(\xi_{0}-x_{0}\left(t_{0}\right), \xi_{1}-x_{0}\left(t_{1}\right), \ldots,\right. \\
& \left.\quad \xi_{n}-x_{0}\left(t_{n}\right), \xi_{n}-x_{0}\left(t_{n}\right)+v\right) \exp \left\{-\frac{v^{2}}{2\left(T-t_{n}\right)}\right\} \mathrm{d} v
\end{aligned}
$$

for $P_{X_{n}}$-a.e. $\vec{\xi}_{n}=\left(\xi_{0}, \xi_{1}, \ldots, \xi_{n}\right) \in \mathbb{R}^{n+1}$.
Suppose that $V$ is a nonnegative continuous function on $\mathbb{R}$ satisfying the condition

$$
\int_{\mathbb{R}} V(\xi) \exp \left\{-\frac{\xi^{2}}{2 t}\right\} \mathrm{d} \xi<\infty
$$

for every $t>0$. For $\xi_{j-1}, \xi_{j} \in \mathbb{R}$ and $0=t_{0}<t_{j-1}<t_{j}$, let

$$
\begin{aligned}
& U\left(\xi_{j-1}, \xi_{j}, t_{j-1}, t_{j}\right)=\left[\frac{1}{2 \pi\left(t_{j}-t_{j-1}\right)}\right]^{1 / 2} \exp \left\{-\frac{\left(\xi_{j}-\xi_{j-1}\right)^{2}}{2\left(t_{j}-t_{j-1}\right)}\right\} \\
& \quad \times E_{w_{\varphi}}\left[\exp \left\{-\int_{t_{j-1}}^{t_{j}} V(x(s)) \mathrm{d} s\right\} \mid x\left(t_{0}\right)=0, x\left(t_{j-1}\right)=\xi_{j-1}, x\left(t_{j}\right)=\xi_{j}\right]
\end{aligned}
$$

By (4.6) in [9] and Theorem 2.4, it is not difficult show that for a.e. $\left(\xi_{1}, \ldots, \xi_{n+1}\right) \in$ $\mathbb{R}^{n+1}$

$$
\begin{gathered}
E_{w_{\varphi}}\left[\exp \left\{-\int_{0}^{T} V(x(s)) \mathrm{d} s\right\} \mid x\left(t_{0}\right)=\xi_{0}, x\left(t_{1}\right)=\xi_{1}, \ldots, x\left(t_{n+1}\right)=\xi_{n+1}\right] \\
=\prod_{j=1}^{n+1}\left[2 \pi\left(t_{j}-t_{j-1}\right)\right]^{1 / 2} U\left(\xi_{j-1}, \xi_{j}, t_{j-1}, t_{j}\right) \exp \left\{\frac{\left(\xi_{j}-\xi_{j-1}\right)^{2}}{2\left(t_{j}-t_{j-1}\right)}\right\}
\end{gathered}
$$

where $\xi_{0}=0$ and $0=t_{0}<t_{1}<\ldots<t_{n}<t_{n+1}=T$.
We are now ready to write out an expression for the multi-conditional expectation. Indeed, by Theorem 2.5, we can write

$$
\begin{aligned}
E_{w_{\varphi}} & {\left[\exp \left\{-\int_{0}^{T} V(x(s)) \mathrm{d} s\right\} \mid x\left(t_{0}\right)=\xi_{0}, x\left(t_{1}\right)=\xi_{1}, \ldots, x\left(t_{n}\right)=\xi_{n}\right] } \\
= & {\left[\prod_{j=1}^{n}\left[2 \pi\left(t_{j}-t_{j-1}\right)\right]^{1 / 2} \exp \left\{\frac{\left(\xi_{j}-\xi_{j-1}\right)^{2}}{2\left(t_{j}-t_{j-1}\right)}\right\} U\left(\xi_{j-1}, \xi_{j}, t_{j-1}, t_{j}\right)\right] } \\
& \times \int_{\mathbb{R}} U\left(\xi_{n}, \xi_{n+1}, t_{n}, T\right) \mathrm{d} \xi_{n+1}
\end{aligned}
$$

for a.e. $\left(\xi_{1}, \ldots, \xi_{n}\right) \in \mathbb{R}^{n}$.

## 5. Evaluation of Conditional analytic Feynman $w_{\varphi}$-Integrals

In this section, we evaluate the conditional analytic Feynman $w_{\varphi}$-integrals of several functions on $C[0, T]$.

In the following two theorems, we evaluate the conditional analytic Feynman $w_{\varphi^{-}}$ integrals of the function $F_{m}$ given as in Theorems 3.1 and 3.2. Using similar methods in the proofs of Theorems 3.1 and 3.2, we can easily prove the theorems.

Theorem 5.1. Let $X_{n+1}$ be given by (2.3). Then, under the assumptions and notations given as in Theorem 3.1, $E^{a n w_{\lambda}}\left[F_{m} \mid X_{n+1}\right]\left(\vec{\xi}_{n+1}\right)$ exists for $\lambda \in \mathbb{C}_{+}$and for $P_{X_{n+1}}$-a.e. $\vec{\xi}_{n+1} \in \mathbb{R}^{n+2}$. Moreover, for a non-zero real $q$, $E^{\text {anf }}{ }_{q}\left[F_{m} \mid X_{n+1}\right]\left(\vec{\xi}_{n+1}\right)$ exists and it is given by

$$
\begin{aligned}
& E^{a n f_{q}}\left[F_{m} \mid X_{n+1}\right]\left(\vec{\xi}_{n+1}\right) \\
& \quad=\sum_{j=1}^{n+1} \sum_{k=0}^{\left[\frac{m}{2}\right]} \sum_{l=0}^{m-2 k}\left(\frac{i}{q}\right)^{k} \frac{m!(l+k)!\left(t_{j}-t_{j-1}\right)^{k+1} \xi_{j-1}^{m-2 k-l}\left(\xi_{j}-\xi_{j-1}\right)^{l}}{2^{k} l!(m-2 k-l)!(l+2 k+1)!} .
\end{aligned}
$$

Theorem 5.2. Let $X_{n}$ be given by (2.5). Then, under the assumptions and notations given as in Theorem 3.2, $E^{a n w_{\lambda}}\left[F_{m} \mid X_{n}\right]\left(\vec{\xi}_{n}\right)$ exists for $\lambda \in \mathbb{C}_{+}$and for $P_{X_{n}}$-a.e. $\vec{\xi}_{n} \in \mathbb{R}^{n+1}$. Moreover, for a non-zero real $q$, $E^{\text {anf } f_{q}}\left[F_{m} \mid X_{n}\right]\left(\vec{\xi}_{n}\right)$ exists and it is given by

$$
\begin{aligned}
& E^{a n f_{q}}\left[F_{m} \mid X_{n}\right]\left(\vec{\xi}_{n}\right) \\
& =\sum_{j=1}^{n} \sum_{k=0}^{\left[\frac{m}{2}\right]} \sum_{l=0}^{m-2 k}\left(\frac{i}{q}\right)^{k} \frac{m!(l+k)!\left(t_{j}-t_{j-1}\right)^{k+1} \xi_{j-1}^{m-2 k-l}\left(\xi_{j}-\xi_{j-1}\right)^{l}}{2^{k} l!(m-2 k-l)!(l+2 k+1)!} \\
& \quad+\sum_{k=0}^{\left[\frac{m}{2}\right]} \sum_{l=0}^{\left[\frac{m-2 k}{2}\right]}\left(\frac{i}{q}\right)^{k+l} \frac{m!(2 l+k)!\xi_{n}^{m-2 k-2 l}\left(T-t_{n}\right)^{l+k+1}}{2^{l+k} l!(m-2 k-2 l)!(2 l+2 k+1)!} .
\end{aligned}
$$

Let $\mathscr{M}\left(L_{2}[0, T]\right)$ be the class of $\mathbb{C}$-valued Borel measures of finite variation on $L_{2}[0, T]$ and let $\mathscr{S}_{w_{\varphi}}$ be the space of functions $F$ of the form for $\sigma \in \mathscr{M}\left(L_{2}[0, T]\right)$

$$
\begin{equation*}
F(x)=\int_{L_{2}[0, T]} \exp \{\mathrm{i}(v, x)\} \mathrm{d} \sigma(v) \tag{5.1}
\end{equation*}
$$

for $x \in C[0, T]$. Let $0=t_{0}<t_{1}<\ldots<t_{n}<t_{n+1}=T$ be a partition of the interval $[0, T]$ and for $v \in L_{2}[0, T]$ define the sectional average $\bar{v}$ of $v$ by letting

$$
\begin{equation*}
\bar{v}(t)=\frac{1}{t_{j}-t_{j-1}} \int_{t_{j-1}}^{t_{j}} v(s) \mathrm{d} s \tag{5.2}
\end{equation*}
$$

on each subinterval $\left(t_{j-1}, t_{j}\right]$ and by letting $\bar{v}(0)=0([6])$. Then, we have for $v \in L_{2}[0, T]$ and $x \in C[0, T]$

$$
\begin{align*}
(v,[x]) & =\int_{0}^{T} v(t) d[x](t)=\sum_{j=1}^{n+1} \frac{x\left(t_{j}\right)-x\left(t_{j-1}\right)}{t_{j}-t_{j-1}} \int_{t_{j-1}}^{t_{j}} v(t) \mathrm{d} t  \tag{5.3}\\
& =\sum_{j=1}^{n+1} \bar{v}\left(t_{j}\right)\left(x\left(t_{j}\right)-x\left(t_{j-1}\right)\right)=\sum_{j=1}^{n+1} \int_{t_{j-1}}^{t_{j}} \bar{v}(t) d x(t)=(\bar{v}, x) .
\end{align*}
$$

We are now ready to evaluate the conditional analytic Feynman $w_{\varphi}$-integrals of the functions in $\mathscr{S}_{w_{\varphi}}$.

Theorem 5.3. Let $X_{n+1}$ and $F \in \mathscr{S}_{w_{\varphi}}$ be given by (2.3) and (5.1), respectively. Then, for $\lambda \in \mathbb{C}_{+}$, $E^{a n w_{\lambda}}\left[F \mid X_{n+1}\right]\left(\vec{\xi}_{n+1}\right)$ exists for $P_{X_{n+1}}$-a.e. $\vec{\xi}_{n+1}=$ $\left(\xi_{0}, \xi_{1}, \ldots, \xi_{n+1}\right) \in \mathbb{R}^{n+2}$ and it is given by

$$
E^{a n w_{\lambda}}\left[F \mid X_{n+1}\right]\left(\vec{\xi}_{n+1}\right)=\int_{L_{2}[0, T]} \exp \left\{\mathrm{i} \sum_{j=1}^{n+1} \bar{v}\left(t_{j}\right)\left(\xi_{j}-\xi_{j-1}\right)-\frac{1}{2 \lambda}\|v-\bar{v}\|_{2}^{2}\right\} \mathrm{d} \sigma(v)
$$

where $\bar{v}$ is given by (5.2). Moreover, for a non-zero real $q$, $E^{a n f_{q}}\left[F \mid X_{n+1}\right]\left(\vec{\xi}_{n+1}\right)$ exists and it is given by

$$
E^{a n f_{q}}\left[F \mid X_{n+1}\right]\left(\vec{\xi}_{n+1}\right)=\int_{L_{2}[0, T]} \exp \left\{\mathrm{i} \sum_{j=1}^{n+1} \bar{v}\left(t_{j}\right)\left(\xi_{j}-\xi_{j-1}\right)+\frac{1}{2 q \mathrm{q}}\|v-\bar{v}\|_{2}^{2}\right\} \mathrm{d} \sigma(v)
$$

Proof. For $\lambda>0$ and $P_{X_{n+1}}$-a.e. $\vec{\xi}_{n+1} \in \mathbb{R}^{n+2}$, we have by Fubini's theorem

$$
\begin{aligned}
& E\left[F\left(\lambda^{-1 / 2}(x-[x])+\left[\vec{\xi}_{n+1}\right]\right)\right] \\
& \quad=\int_{L_{2}[0, T]} \exp \left\{\mathrm{i}\left(v,\left[\vec{\xi}_{n+1}\right]\right)\right\} \int_{C} \exp \left\{\mathrm{i} \lambda^{-1 / 2}(v-\bar{v}, x)\right\} \mathrm{d} w_{\varphi}(x) \mathrm{d} \sigma(v)
\end{aligned}
$$

by (5.3). Using the following well-known integration formula

$$
\begin{equation*}
\int_{\mathbb{R}} \exp \left\{-a u^{2}+\mathrm{i} b u\right\} \mathrm{d} u=\left(\frac{\pi}{a}\right)^{1 / 2} \exp \left\{-\frac{b^{2}}{4 a}\right\} \tag{5.4}
\end{equation*}
$$

for $a \in \mathbb{C}_{+}$and any real $b$, we have
$E\left[F\left(\lambda^{-1 / 2}(x-[x])+\left[\vec{\xi}_{n+1}\right]\right)\right]=\int_{L_{2}[0, T]} \exp \left\{\mathrm{i} \sum_{j=1}^{n+1} \bar{v}\left(t_{j}\right)\left(\xi_{j}-\xi_{j-1}\right)-\frac{1}{2 \lambda}\|v-\bar{v}\|_{2}^{2}\right\} \mathrm{d} \sigma(v)$
since $(v-\bar{v}, \cdot)$ is mean zero Gaussian with variance $\|v-\bar{v}\|_{2}^{2}$ by Theorem 1.2. By Morera's theorem and the dominated convergence theorem, we have the results.

Letting $\lambda=1$ in the result of Theorem 5.3, we have the conditional $w_{\varphi}$-integral of $F$ in $\mathscr{S}_{w_{\varphi}}$.

Corollary 5.1. Under the assumptions and notations given as in Theorem 5.3, we have for $P_{X_{n+1}}$-a.e. $\vec{\xi}_{n+1} \in \mathbb{R}^{n+2}$

$$
E\left[F \mid X_{n+1}\right]\left(\vec{\xi}_{n+1}\right)=\int_{L_{2}[0, T]} \exp \left\{\mathrm{i} \sum_{j=1}^{n+1} \bar{v}\left(t_{j}\right)\left(\xi_{j}-\xi_{j-1}\right)-\frac{1}{2}\|v-\bar{v}\|_{2}^{2}\right\} \mathrm{d} \sigma(v)
$$

Theorem 5.4. Let $X_{n}$ and $F \in \mathscr{S}_{w_{\varphi}}$ be given by (2.5) and (5.1), respectively. Then, for $\lambda \in \mathbb{C}_{+}, E^{a n w_{\lambda}}\left[F \mid X_{n}\right]\left(\vec{\xi}_{n}\right)$ exists for $P_{X_{n}}$-a.e. $\vec{\xi}_{n}=\left(\xi_{0}, \xi_{1}, \ldots, \xi_{n}\right) \in \mathbb{R}^{n+1}$ and it is given by

$$
\begin{aligned}
& E^{a n w_{\lambda}}\left[F \mid X_{n}\right]\left(\vec{\xi}_{n}\right) \\
& \quad=\int_{L_{2}[0, T]} \exp \left\{\mathrm{i} \sum_{j=1}^{n} \bar{v}\left(t_{j}\right)\left(\xi_{j}-\xi_{j-1}\right)-\frac{1}{2 \lambda}\left[\|v-\bar{v}\|_{2}^{2}+\left(T-t_{n}\right)[\bar{v}(T)]^{2}\right]\right\} \mathrm{d} \sigma(v)
\end{aligned}
$$

where $\bar{v}$ is given by (5.2). Moreover, for a non-zero real $q$, $E^{a n f_{q}}\left[F \mid X_{n}\right]\left(\vec{\xi}_{n}\right)$ exists and it is given by

$$
\begin{aligned}
& E^{a n f_{q}}\left[F \mid X_{n}\right]\left(\vec{\xi}_{n}\right) \\
& \quad=\int_{L_{2}[0, T]} \exp \left\{\mathrm{i} \sum_{j=1}^{n} \bar{v}\left(t_{j}\right)\left(\xi_{j}-\xi_{j-1}\right)+\frac{1}{2 q \mathrm{i}}\left[\|v-\bar{v}\|_{2}^{2}+\left(T-t_{n}\right)[\bar{v}(T)]^{2}\right]\right\} \mathrm{d} \sigma(v) .
\end{aligned}
$$

Proof. For notational convenience, let $\vec{\xi}_{n}=\left(\xi_{0}, \xi_{1}, \ldots, \xi_{n}\right) \in \mathbb{R}^{n+1}$ and $\vec{\xi}_{n+1}=$ $\left(\xi_{0}, \xi_{1}, \ldots, \xi_{n}, \xi_{n+1}\right)$ for $\xi_{n+1} \in \mathbb{R}$. Moreover, let $\left[\vec{\xi}_{n+1}\right]$ be the polygonal function of $\vec{\xi}_{n+1}$. For $\lambda>0$ and $P_{X_{n}}$-a.e. $\vec{\xi}_{n} \in \mathbb{R}^{n+1}$, we have by Theorems 2.5 and 5.3

$$
\begin{aligned}
& K_{\lambda} \equiv {\left[\frac{\lambda}{2 \pi\left(T-t_{n}\right)}\right]^{1 / 2} \int_{\mathbb{R}} E\left[F\left(\lambda^{-1 / 2}(x-[x])+\left[\vec{\xi}_{n+1}\right]\right)\right] } \\
& \quad \times \exp \left\{-\frac{\lambda\left(\xi_{n+1}-\xi_{n}\right)^{2}}{2\left(T-t_{n}\right)}\right\} \mathrm{d} \xi_{n+1} \\
&=\left[\frac{\lambda}{2 \pi\left(T-t_{n}\right)}\right]^{1 / 2} \int_{L_{2}[0, T]} \exp \left\{\mathrm{i} \sum_{j=1}^{n} \bar{v}\left(t_{j}\right)\left(\xi_{j}-\xi_{j-1}\right)-\frac{1}{2 \lambda}\|v-\bar{v}\|_{2}^{2}\right\} \\
& \quad \times \int_{\mathbb{R}} \exp \left\{\mathrm{i} \bar{v}(T)\left(\xi_{n+1}-\xi_{n}\right)-\frac{\lambda\left(\xi_{n+1}-\xi_{n}\right)^{2}}{2\left(T-t_{n}\right)}\right\} \mathrm{d} \xi_{n+1} \mathrm{~d} \sigma(v)
\end{aligned}
$$

by Fubini's theorem where $\bar{v}$ is the sectional average of $v$ given by (5.2). Let $u=$ $\xi_{n+1}-\xi_{n}$. Then we have by the change of variable theorem

$$
\begin{aligned}
K_{\lambda}= & {\left[\frac{\lambda}{2 \pi\left(T-t_{n}\right)}\right]^{1 / 2} \int_{L_{2}[0, T]} \exp \left\{\mathrm{i} \sum_{j=1}^{n} \bar{v}\left(t_{j}\right)\left(\xi_{j}-\xi_{j-1}\right)-\frac{1}{2 \lambda}\|v-\bar{v}\|_{2}^{2}\right\} } \\
& \times \int_{\mathbb{R}} \exp \left\{i[\bar{v}(T)] u-\frac{\lambda u^{2}}{2\left(T-t_{n}\right)}\right\} \mathrm{d} u \mathrm{~d} \sigma(v) \\
= & \int_{L_{2}[0, T]} \exp \left\{\mathrm{i} \sum_{j=1}^{n} \bar{v}\left(t_{j}\right)\left(\xi_{j}-\xi_{j-1}\right)-\frac{1}{2 \lambda}\|v-\bar{v}\|_{2}^{2}-\frac{\left(T-t_{n}\right)[\bar{v}(T)]^{2}}{2 \lambda}\right\} \mathrm{d} \sigma(v)
\end{aligned}
$$

by (5.4). By Morera's theorem and the dominated convergence theorem, we have the results.

Now, letting $\lambda=1$ in the result of Theorem 5.4, we have the following corollary.

Corollary 5.2. Under the assumptions and notations given as in Theorem 5.4, we have for $P_{X_{n}}$-a.e. $\vec{\xi}_{n} \in \mathbb{R}^{n+1}$

$$
\begin{aligned}
& E\left[F \mid X_{n}\right]\left(\vec{\xi}_{n}\right) \\
& \quad=\int_{L_{2}[0, T]} \exp \left\{\mathrm{i} \sum_{j=1}^{n} \bar{v}\left(t_{j}\right)\left(\xi_{j}-\xi_{j-1}\right)-\frac{1}{2}\left[\|v-\bar{v}\|_{2}^{2}+\left(T-t_{n}\right)[\bar{v}(T)]^{2}\right]\right\} \mathrm{d} \sigma(v) .
\end{aligned}
$$
