# A note on copies of $c_0$ in spaces of weak\* measurable functions

J.C. FERRANDO

Abstract. If  $(\Omega, \Sigma, \mu)$  is a finite measure space and X a Banach space, in this note we show that  $L^1_{w^*}(\mu, X^*)$ , the Banach space of all classes of weak<sup>\*</sup> equivalent X<sup>\*</sup>-valued weak<sup>\*</sup> measurable functions f defined on  $\Omega$  such that  $||f(\omega)|| \leq g(\omega)$  a.e. for some  $g \in L_1(\mu)$  equipped with its usual norm, contains a copy of  $c_0$  if and only if X<sup>\*</sup> contains a copy of  $c_0$ .

Keywords: weak\* measurable function, copy of  $c_0$ , copy of  $\ell_1$ Classification: 46G10, 46E40

### 1. Preliminaries

Throughout this paper  $(\Omega, \Sigma, \mu)$  will be a complete finite measure space and X a real or complex Banach space. We denote by  $\mathcal{L}_{w^*}^p(\mu, X^*)$ ,  $1 \leq p \leq \infty$ , the linear space over  $\mathbb{K}$  of all weak\* measurable functions  $f: \Omega \to X^*$  for which there exists a scalar function  $g \in \mathcal{L}_p(\mu)$  such that  $||f(\omega)|| \leq g(\omega)$  for  $\mu$ -almost all  $\omega \in \Omega$ , whereas  $L_{w^*}^p(\mu, X^*)$  stands for the quotient space of  $\mathcal{L}_{w^*}^p(\mu, X^*)$  via the equivalence relation  $\sim^*$  defined by  $f_1 \sim^* f_2$  whenever  $f_1() x \sim f_2() x$  for each  $x \in X$  (here  $\sim$  designs the usual equivalence relation in  $\mathcal{L}_p(\mu)$ ). The space  $L_{w^*}^p(\mu, X^*)$  is a Banach space when equipped with the norm  $\left\| \hat{f} \right\|_p = \inf \|g\|_{L_p(\mu)}$ , the infimum taken over all those functions  $g \in \mathcal{L}_p(\mu)$  for which there is some  $f \in \hat{f}$  such that  $\|f(\omega)\| \leq g(\omega)$  for  $\mu$ -almost all  $\omega \in \Omega$ . It can be shown that there is always some  $h \in \hat{f}$  such that  $\|h()\| \in \mathcal{L}_p(\mu)$  and  $\|\hat{f}\|_p = \|\|h()\|\|_{L_p(\mu)}$ . We identify  $L_p(\mu, X)^*$  with  $L_{w^*}^q(\mu, X^*)$ , where  $1 \leq p < \infty$  and  $\frac{1}{p} + \frac{1}{q} = 1$ , by means of the linear isometry  $T: L_{w^*}^q(\mu, X^*) \to L_p(\mu, X)^*$  defined by  $(T\hat{f})g = \int_{\Omega} \langle f(\omega), g(\omega) \rangle d\mu(\omega)$  for every  $f \in \hat{f}$ . A study of  $L_{w^*}^p(\mu, X^*)$  coincides with the space of all weak\* measurable functions  $f: \Omega \to X^*$  such that  $\|f()\| \in \mathcal{L}_p(\mu)$ . In this case  $L_{w^*}^p(\mu, X^*)$  is the quotient of  $\mathcal{L}_{w^*}^p(\mu, X^*)$  via the usual equivalence relation, so  $\|\hat{f}\|_p = \|\|f()\|\|_{L_p(\mu)}$  for each  $f \in \hat{f}$ . We denote by  $cabv(\Sigma, X^*)$  the Banach space of all  $X^*$ -valued countably additive measures F of bounded

variation defined in  $\Sigma$ , equipped with the variation norm  $|F| = |F|(\Omega)$ . A result of Kwapień [7] answering a question of Hoffmann-Jørgensen [5] shows that  $L_p(\mu, X)$ ,  $1 \leq p < \infty$ , contains a copy of  $c_0$  if and only if X does. Since (as Mendoza has proved [8])  $L_p(\mu, X)$ ,  $1 , contains a complemented copy of <math>\ell_1$  if and only if X contains a complemented copy of  $\ell_1$ , then  $L_{w^*}^p(\mu, X^*)$ , 1 , contains $a copy of <math>c_0$  if and only if  $X^*$  does. In this note we show that this is also true for p = 1, i.e., that  $L_{w^*}^1(\mu, X^*)$  contains a copy of  $c_0$  if and only if  $X^*$  does.

# 2. Copies of $c_0$ in $L^1_{w^*}(\mu, X^*)$

If X is a separable Banach space, our statement is an easy consequence of an averaging theorem for  $c_0$ -sequences due to Bourgain [1] (see also [2, Lemma 2.1.2]). The general case will be derived from Theorem 2.2 below, otherwise well known.

**Theorem 2.1.** Assume that X is a separable Banach space. If  $L^1_{w^*}(\mu, X^*)$  contains a copy of  $c_0$ , then  $X^*$  contains a copy of  $c_0$ .

PROOF: Let  $\{\widehat{f}_n\}$  be a normalized basic sequence in  $L^1_{w^*}(\mu, X^*)$  equivalent to the unit vector basis of  $c_0$ . Then  $\int_{\Omega} ||f_n(\omega)|| d\mu(\omega) = 1$  for each  $n \in \mathbb{N}$  and there is K > 0 such that

(2.1) 
$$\sup_{n \in \mathbb{N}} \int_{\Omega} \left\| \sum_{i=1}^{n} \varepsilon_{i} f_{i}(\omega) \right\| d\mu(\omega) < K$$

for each  $f_i \in \widehat{f_i}$ ,  $\varepsilon_i \in \{-1, 1\}$  and  $i \in \mathbb{N}$ . Setting

$$A_{1} = \left\{ \omega \in \Omega : \overline{\lim}_{n \to \infty} \left\| f_{n} \left( \omega \right) \right\| > 0 \right\},\$$

we claim that  $\mu(A_1) > 0$ . Otherwise,  $\lim_{n\to\infty} ||f_n(\omega)|| = 0$  for almost all  $\omega \in \Omega$  and since the sequence  $\{||f_n()||\}$  is uniformly integrable (this is essentially contained in the proof of [2, Theorem 2.1.1]), it follows from Vitali's lemma [4, IV.10.9] that  $\lim_{n\to\infty} \int_{\Omega} ||f_n(\omega)|| d\mu(\omega) = 0$ , a contradiction.

Denoting by  $\Delta$  the product space  $\{-1,1\}^{\mathbb{N}}$ ,  $\Gamma$  the  $\sigma$ -algebra of subsets of  $\Delta$ generated by the *n*-cylinders of  $\Delta$ ,  $n = 1, 2, \ldots$ , and  $\nu$  the probability measure  $\otimes_{i=1}^{\infty}\nu_i$  on  $\Gamma$ , where  $\nu_i : 2^{\{-1,1\}} \to [0,1]$  satisfies that  $\nu_i(\emptyset) = 0$ ,  $\nu_i(\{-1\}) = \nu_i(\{1\}) = 1/2$  and  $\nu_i(\{-1,1\}) = 1$  for each  $i \in \mathbb{N}$ , we may consider the  $\mu$ measurable map  $h_n : \Omega \to \mathbb{R}$  defined by  $h_n(\omega) = \int_{\Delta} \|\sum_{i=1}^n \varepsilon_i f_i(\omega)\| d\nu(\varepsilon)$ for  $n = 1, 2, \ldots$ . Since  $\{h_n\}$  is a monotone increasing sequence of non negative functions, (2.1) and Fubini's theorem yield  $\sup_{n \in \mathbb{N}} \int_{\Omega} h_n(\omega) d\mu(\omega) \leq K$ . Hence, by the monotone convergence theorem there exists a  $\mu$ -null set  $A_2 \in \Sigma$  such that  $\sup_{n \in \mathbb{N}} h_n(\omega) < \infty$  for each  $\omega \in \Omega - A_2$ . Considering the set  $A := A_1 \cap (\Omega - A_2)$ , it is obvious that  $\mu(A) > 0$ , hence  $A \neq \emptyset$ . Moreover,  $\overline{\lim_{n\to\infty}} \|f_n(\omega)\| > 0$  and  $\sup_{n \in \mathbb{N}} \int_{\Delta} \|\sum_{i=1}^n \varepsilon_i f_i(\omega)\| d\nu(\varepsilon) < \infty$  for each  $\omega \in A$ . Choose  $\omega_0 \in A$  and a strictly increasing sequence of positive integers  $\{n_i\}$  such that  $\inf_{i\in\mathbb{N}} \|f_{n_i}(\omega_0)\| > 0$ . Setting  $x_i^* := f_{n_i}(\omega_0)$  for each  $i \in \mathbb{N}$  and using the properties of the measure space we conclude that  $\sup_{n\in\mathbb{N}} \int_{\Delta} \left\|\sum_{i=1}^n \varepsilon_i x_i^*\right\| d\nu(\varepsilon) < \infty$ . According to the aforementioned theorem of Bourgain, there is a subsequence  $\{z_n^*\}$  of  $\{x_n^*\}$  which is a basic sequence in  $X^*$  equivalent to the unit vector basis of  $c_0$ .

**Theorem 2.2.** If X is an arbitrary Banach space, then  $L^1_{w^*}(\mu, X^*)$  is linearly isometric to a subspace of  $cabv(\Sigma, X^*)$ .

PROOF: Consider the natural map  $T: L^1_{w^*}(\mu, X^*) \to cabv(\Sigma, X^*)$  defined by  $T\widehat{f} = F$ , where

$$F(A) x = \int_{A} f(\omega) x d\mu(\omega)$$

for each  $A \in \Sigma$  and  $x \in X$ . It is easy to check that F is an  $X^*$ -valued  $\mu$ -continuous countably additive measure, since if  $f \in \widehat{f}$  verifies that  $||f(\omega)|| \leq g(\omega)$  for  $\mu$ almost all  $\omega \in \Omega$  and some  $g \in L_1(\mu)$ , then  $||F(A)|| \leq ||\chi_A g||_{L_1(\mu)}$  for each  $A \in \Sigma$ . If  $\pi(A)$  designs the class of all finite partitions of  $A \in \Sigma$  by elements of  $\Sigma$ , then

$$\sum_{E \in \pi(A)} \|F(E)\| \le \sum_{E \in \pi(A)} \int_{E} g(\omega) \ d\mu(\omega) = \|\chi_{A}g\|_{L_{1}(\mu)} \le \|g\|_{L_{1}(\mu)}$$

which proves that  $F \in cabv\left(\Sigma, X^*\right)$  and  $|F| \leq \left\|\widehat{f}\right\|_1$ .

According to [2, Theorem 1.5.3] there exists a weak\* measurable function  $\psi$ :  $\Omega \to X^*$  satisfying that  $(\omega \to ||\psi(\omega)||) \in \mathcal{L}_1(\mu)$ ,  $F(A) x = \int_A \psi(\omega) x \, d\mu(\omega)$  for all  $A \in \Sigma$  and  $x \in X$ , and  $|F|(A) = \int_A ||\psi(\omega)|| \, d\mu(\omega)$ . Clearly  $\psi \in \mathcal{L}^1_{w^*}(\mu, X^*)$ and  $\psi \sim^* f$ . Consequently,

$$\left\| \widehat{f} \right\|_{1} \leq \int_{\Omega} \left\| \psi\left( \omega \right) \right\| \, d\mu\left( \omega \right) = |F|$$

This shows that  $\left|T\widehat{f}\right| = \left\|\widehat{f}\right\|_{1}$ , which concludes the proof.

**Corollary 2.3.** If  $L^1_{w^*}(\mu, X^*)$  contains a copy of  $c_0$ , then  $X^*$  contains a copy of  $c_0$ .

PROOF: If  $L^1_{w^*}(\mu, X^*)$  contains a copy of  $c_0$ , by the previous theorem  $c_0$  embeds into  $cabv(\Sigma, X^*)$ . So  $X^*$  contains a copy of  $c_0$  by virtue of E. and P. Saab's theorem [9] ([2, Theorem 3.1.3]).

Acknowledgment. The author is indebted to the referee for his help in the proof of the nonseparable case.
