# An inequality in Orlicz function spaces with Orlicz norm 

Jincai Wang

#### Abstract

We use Simonenko quantitative indices of an $\mathcal{N}$-function $\Phi$ to estimate two parameters $q_{\Phi}$ and $Q_{\Phi}$ in Orlicz function spaces $L^{\Phi}[0, \infty)$ with Orlicz norm, and get the following inequality: $\frac{B_{\Phi}}{B_{\Phi}-1} \leq q_{\Phi} \leq Q_{\Phi} \leq \frac{A_{\Phi}}{A_{\phi}-1}$, where $A_{\Phi}$ and $B_{\Phi}$ are Simonenko indices. A similar inequality is obtained in $L^{\Phi}[0,1]$ with Orlicz norm.

Keywords: Orlicz spaces, Simonenko indices, $\triangle_{2}$-condition
Classification: 46B20, 46E30

## 1. Introduction

Definition 1.1. A function $M: \mathbb{R} \longrightarrow \mathbb{R}$ is called an $\mathcal{N}$-function, if
(i) $M$ is continuous, convex and even;
(ii) $M(u)>0$ for $u \neq 0, M(0)=0$;
(iii) $\lim _{u \rightarrow 0} M(u) / u=0, \lim _{u \rightarrow \infty} M(u) / u=\infty$.

Let

$$
\Phi(u)=\int_{0}^{|u|} \phi(t) d t \text { and } \Psi(v)=\int_{0}^{|v|} \psi(s) d s
$$

be a pair of complementary $\mathcal{N}$-functions. The Orlicz function space is defined as follows: $L^{\Phi}[0,1]=\left\{x(t): x(t)\right.$ is measurable on $[0,1]$ and $\rho_{\Phi}(\lambda x(t)) d t<\infty$ for some $\lambda>0\}$, where $\rho_{\Phi}(x(t))=\int_{[0,1]} \Phi(x(t)) d t ; L^{\Phi}[0, \infty)=\{x(t): x(t)$ is measurable on $[0, \infty), \rho_{\Phi}(\lambda x(t)) d t<\infty$ for some $\left.\lambda>0\right\}$, and $\rho_{\Phi}(x(t))=$ $\int_{[0, \infty)} \Phi(x(t)) d t$. We define the Orlicz norm on the Orlicz space as

$$
\|x\|_{\Phi}=\inf _{k>0} \frac{1}{k}\left[1+\rho_{\Phi}(k x)\right]
$$

An $\mathcal{N}$-function $\Phi(u)$ is said to satisfy the $\triangle_{2}$-condition for small $u$ (in symbol $\left.\Phi \in \triangle_{2}(0)\right)$, if there exists $u_{0}>0$ and $C>0$, such that $\Phi(2 u) \leq C \Phi(u)$ for $0 \leq u \leq u_{0} . \quad \Phi(u)$ is said to satisfy the $\triangle_{2}$-condition for large $u$ (in symbol $\left.\Phi \in \triangle_{2}(\infty)\right)$, if there exists $u_{0}>0$ and $C>0$ such that $\Phi(2 u) \leq C \Phi(u)$ for $u \geq u_{0} . \Phi(u)$ is said to satisfy the $\triangle_{2}$-condition for all $u \geq 0$ (in symbol $u \in \triangle_{2}$ ), if there exist $C>0$ such that $\Phi(2 u) \leq C \Phi(u)$ for $u \geq 0$. An $\mathcal{N}$-function
$\Phi(u)$ is said to satisfy the $\nabla_{2}$-condition for small $u$ (for large $u$, for all $u \geq 0$ ), in symbol $\Phi \in \nabla_{2}(0)\left(\Phi \in \nabla_{2}(\infty), \Phi \in \nabla_{2}\right)$, if its complementary $\mathcal{N}$-function $\Psi \in \triangle_{2}(0)\left(\Psi \in \triangle_{2}(\infty), \Psi \in \triangle_{2}\right)$.

The basic results on Orlicz spaces can be found in Krasnosel'skii and Rutickii [2], Lindenstrauss and Tzafriri [3], Rao and Ren [6], Chen [1].

The Simonenko indices of an $\mathcal{N}$-function $\Phi$ are defined as

$$
\begin{equation*}
A_{\Phi}=\inf _{t>0} \frac{t \phi(t)}{\Phi(t)}, \quad B_{\Phi}=\sup _{t>0} \frac{t \phi(t)}{\Phi(t)} \tag{1}
\end{equation*}
$$

Simonenko introduced these indices in [9] and [8], and we can find a detailed description in Maligranda [4].

Clearly, $1 \leq A_{\Phi} \leq B_{\Phi} \leq \infty$.
Proposition 1.1. Let $\Phi$ be an $\mathcal{N}$-function. Then
$\Phi \in \nabla_{2} \Longleftrightarrow 1<A_{\Phi} ; \quad \Phi \in \triangle_{2} \Longleftrightarrow B_{\Phi}<\infty$.
The proof of the proposition can be found in Krasnosel'skii and Rutickii [2, p. 24-26].

Lemma 1.2. Let $\Phi$ and $\Psi$ be a pair of complementary $\mathcal{N}$-functions. Then

$$
\begin{equation*}
\frac{1}{A_{\Phi}}+\frac{1}{B_{\Psi}}=1 \tag{2}
\end{equation*}
$$

The proof of Lemma 1.2 can be found in Simonenko [9] or Rao \& Ren [6].
The next lemma can be found in [1], [10] or [5].
Lemma 1.3. Let $\Phi(u)=\int_{0}^{|u|} \phi(t) d t$ and $\Psi(v)=\int_{0}^{|v|} \psi(s) d s$ be a pair of complementary $\mathcal{N}$-functions. We denote

$$
k_{x}^{*}=\inf \left\{k>0: \rho_{\Psi}[\phi(k|x|)] \geq 1\right\}, \quad k_{x}^{* *}=\sup \left\{k>0: \rho_{\Psi}[\phi(k|x|)] \leq 1\right\} .
$$

Then $k \in\left[k_{x}^{*}, k_{x}^{* *}\right]$ if and only if

$$
\|x\|_{\Phi}=\frac{1}{k}\left[1+\rho_{\Phi}(k x)\right] .
$$

## 2. Main results

Y. Yan estimated the two parameters $Q_{\Phi}$ and $q_{\Phi}$ in the Orlicz sequence space $l^{\Phi}$, and got the following result (see [11], [7] or [13]).

Proposition 2.1. Let $\Phi$ and $\Psi$ be a pair of complementary $\mathcal{N}$-functions. Then

$$
\begin{equation*}
\frac{b_{\Phi}^{*}}{b_{\Phi}^{*}-1} \leq q_{\Phi} \leq Q_{\Phi} \leq \frac{a_{\Phi}^{*}}{a_{\Phi}^{*}-1} \tag{3}
\end{equation*}
$$

where

$$
\begin{aligned}
& a_{\Phi}^{*}=\inf \left\{\frac{t \phi(t)}{\Phi(t)}: 0<t \leq \psi\left[\Psi^{-1}(1)\right]\right\} \\
& b_{\Phi}^{*}=\sup \left\{\frac{t \phi(t)}{\Phi(t)}: 0<t \leq \psi\left[\Psi^{-1}(1)\right]\right\}
\end{aligned}
$$

The upper estimate in (3) can also be found in [12]. Now we establish a similar inequality in the Orlicz function space with Orlicz norm. Firstly, we have
Theorem 2.1. Let $\Phi, \Psi$ be a pair of complementary $\mathcal{N}$-functions. For $L^{\Phi}[0, \infty)$, we denote

$$
\begin{aligned}
Q_{\Phi} & =\sup _{\|x\|_{\Phi}=1} k_{x}^{* *}=\sup _{\|x\|_{\Phi}=1}\left\{k>0:\|x\|_{\Phi}=\frac{1}{k}\left(1+\rho_{\Phi}(k x)\right)\right\}, \\
q_{\Phi} & =\inf _{\|x\|_{\Phi}=1} k_{x}^{*}=\inf _{\|x\|_{\Phi}=1}\left\{k>0:\|x\|_{\Phi}=\frac{1}{k}\left(1+\rho_{\Phi}(k x)\right)\right\} .
\end{aligned}
$$

Then

$$
\begin{equation*}
A_{\Psi}=\frac{B_{\Phi}}{B_{\Phi}-1} \leq q_{\Phi} \leq Q_{\Phi} \leq \frac{A_{\Phi}}{A_{\Phi}-1}=B_{\Psi} \tag{4}
\end{equation*}
$$

where $A_{\Phi}, B_{\Phi}, A_{\Psi}$ and $B_{\Psi}$ are defined by (1).
Proof: The left and right equations in (4) follow from Lemma 1.2. Now we prove

$$
\begin{equation*}
q_{\Phi} \geq \frac{B_{\Phi}}{B_{\Phi}-1} \tag{5}
\end{equation*}
$$

For $\Phi \notin \triangle_{2}$, by Proposition 1.1, we have $B_{\Phi}=\infty$ or $A_{\Psi}=1$. The result is obvious.

For $\Phi \in \triangle_{2}$, we only prove that for every $x \in L^{\Phi}[0, \infty)$ which satisfies $\|x\|_{\Phi}=$ 1 , we have $k_{x}^{*} \geq \frac{B_{\Phi}}{B_{\Phi}-1}$. Firstly, we have $\rho_{\Psi}\left(\phi\left(k_{x}^{*}|x(t)|\right)\right) \geq 1$. In fact, if $\Phi \in \triangle_{2}$, then $\rho_{\Phi}\left[\left(k_{x}^{*}+1\right) x\right]<\infty$. So

$$
\begin{aligned}
\rho_{\Psi}\left(\phi\left(\left(k_{x}^{*}+1\right)|x(t)|\right)\right) & \leq \rho_{\Psi}\left(\phi\left(\left(k_{x}^{*}+1\right)|x(t)|\right)\right)+\rho_{\Phi}\left(\left(k_{x}^{*}+1\right)|x(t)|\right) \\
& =\int_{G}\left(k_{x}^{*}+1\right)|x(t)| \cdot \phi\left(\left(k_{x}^{*}+1\right)|x(t)|\right) d t \\
& \leq B_{\Phi} \rho_{\Phi}\left(\left(k_{x}^{*}+1\right)|x(t)|\right)<\infty
\end{aligned}
$$

Choose $k_{x}^{*}<k_{n}<k_{x}^{*}+1$ such that $k_{n} \searrow k_{x}^{*}$. By the right continuity of $\phi$ and Lebesgue dominated convergence theorem, we have

$$
\rho_{\Psi}\left(\phi\left(k_{x}^{*}|x(t)|\right)\right)=\lim _{n \rightarrow \infty} \rho_{\Psi}\left(\phi\left(k_{n}|x(t)|\right)\right) \geq 1
$$

For every $x \in L^{\Phi}[0, \infty)$ which satisfies $\|x\|_{\Phi}=1$, we have

$$
\begin{aligned}
1+\rho_{\Phi}\left(k_{x}^{*} x\right) & \leq \rho_{\Psi}\left(\phi\left(k_{x}^{*}|x(t)|\right)\right)+\rho_{\Phi}\left(k_{x}^{*}|x(t)|\right) \\
& =\int_{[0, \infty)} \Psi\left\{\phi\left[\left(k_{x}^{*}|x(t)|\right)\right]\right\} d t+\int_{[0, \infty)} \Phi\left(k_{x}^{*}|x(t)|\right) d t \\
& =\int_{[0, \infty)} k_{x}^{*}|x(t)| \phi\left(k_{x}^{*}|x(t)|\right) d t \\
& \leq B_{\Phi} \int_{[0, \infty)} \Phi\left(k_{x}^{*}|x(t)|\right) d t=B_{\Phi} \rho_{\Phi}\left(k_{x}^{*} x\right) .
\end{aligned}
$$

This implies

$$
\begin{equation*}
\rho_{\Phi}\left(k_{x}^{*} x\right) \geq \frac{1}{B_{\Phi}-1} \tag{6}
\end{equation*}
$$

By Lemma 1.3, we get

$$
1=\|x\|_{\Phi}=\frac{1}{k_{x}^{*}}\left\{1+\rho_{\Phi}\left(k_{x}^{*} x\right)\right\} .
$$

So $\rho_{\Phi}\left(k_{x}^{*} x\right)=k_{x}^{*}-1$. By (6)

$$
k_{x}^{*} \geq \frac{B_{\Phi}}{B_{\Phi}-1} .
$$

Next, we prove

$$
\begin{equation*}
Q_{\Phi} \leq \frac{A_{\Phi}}{A_{\Phi}-1} \tag{7}
\end{equation*}
$$

If $\Phi \notin \nabla_{2}$, then $A_{\Phi}=1$ or $B_{\Psi}=\infty$. The result is obvious.
If $\Phi \in \nabla_{2}$, then $A_{\Phi}>1$. For every $x \in L^{\Phi}[0, \infty)$ which satisfies $\|x\|_{\Phi}=1$, and for any $k \in\left[k_{x}^{*}, k_{x}^{* *}\right]$, we have

$$
1=\|x\|_{\Phi}=\frac{1}{k}\left[1+\rho_{\Phi}(k x)\right] .
$$

For any $0<\varepsilon<1<k$, we have

$$
\begin{equation*}
1=\|x\|_{\Phi}=\inf _{t>0} \frac{1}{t}\left[1+\rho_{\Phi}(t x)\right] \leq \frac{1}{k-\varepsilon}\left[1+\rho_{\Phi}((k-\varepsilon) x)\right] \tag{8}
\end{equation*}
$$

By the definition of $k_{x}^{* *}$ and $k-\varepsilon<k_{x}^{* *}$, we have

$$
\begin{align*}
1+\rho_{\Phi}[(k-\varepsilon) x] & \geq \rho_{\Psi}\{\phi[(k-\varepsilon) x]\}+\rho_{\Phi}[(k-\varepsilon) x] \\
& =\int_{[0, \infty)}(k-\varepsilon) x(t) \phi[(k-\varepsilon) x(t)] d t  \tag{9}\\
& \geq A_{\Phi} \rho_{\Phi}((k-\varepsilon) x(t)) .
\end{align*}
$$

Therefore by (8) and (9), we have

$$
\left.1 \geq\left(A_{\Phi}-1\right) \rho_{\Phi}((k-\varepsilon) x(t)) \geq\left(A_{\Phi}-1\right)(k-\varepsilon-1)\right)
$$

or

$$
k-\varepsilon \leq \frac{A_{\Phi}}{A_{\Phi}-1}
$$

Since $\varepsilon$ is arbitrary, we have

$$
k \leq \frac{A_{\Phi}}{A_{\Phi}-1} .
$$

This implies (7) since $x$ and $k$ are arbitrary.
Corollary 2.1. (i) If $\Phi \in \nabla_{2}$, then $Q_{\Phi}<\infty$; (ii) If $\Phi \in \triangle_{2}$, then $q_{\Phi}>1$.
For $0 \neq x \in L^{\Phi}[0,1]$, we still denote

$$
\begin{aligned}
k_{x}^{*} & =\inf \left\{k>0: \rho_{\Psi}[\phi(k x)] \geq 1\right\} \\
k_{x}^{* *} & =\sup \left\{k>0: \rho_{\Psi}[\phi(k x)] \leq 1\right\} \\
Q_{\Phi} & =\sup _{\|x\|_{\Phi}=1} k_{x}^{* *}=\sup _{\|x\|_{\Phi}=1}\left\{k>0:\|x\|_{\Phi}=\frac{1}{k}\left(1+\rho_{\Phi}(k x)\right)\right\} \\
q_{\Phi} & =\inf _{\|x\|_{\Phi}=1} k_{x}^{*}=\inf _{\|x\|_{\Phi}=1}\left\{k>0:\|x\|_{\Phi}=\frac{1}{k}\left(1+\rho_{\Phi}(k x)\right)\right\}
\end{aligned}
$$

Let $\varepsilon_{0}=\min \left\{\frac{1}{2 \phi(1)}, 1\right\}$. Denote

$$
\begin{aligned}
& A_{\Phi}^{*}=\inf \left\{\frac{t \phi(t)}{\Phi(t)}: t \in\left[\varepsilon_{0}, \infty\right)\right\} \\
& B_{\Phi}^{*}=\sup \left\{\frac{t \phi(t)}{\Phi(t)}: t \in\left[\varepsilon_{0}, \infty\right)\right\}
\end{aligned}
$$

Obviously, $\varepsilon_{0} \phi\left(\varepsilon_{0}\right) \leq \frac{\phi\left(\varepsilon_{0}\right)}{2 \phi(1)} \leq \frac{1}{2}$.

Theorem 2.2. If $\Phi, \Psi$ is a pair of complementary $\mathcal{N}$-functions, then

$$
\frac{B_{\Phi}^{*}-\varepsilon_{0} \phi\left(\varepsilon_{0}\right)}{B_{\Phi}^{*}-1} \leq q_{\Phi} \leq Q_{\Phi} \leq \frac{A_{\Phi}^{*}+A_{\Phi}^{*} \Phi\left(\varepsilon_{0}\right)}{A_{\Phi}^{*}-1}
$$

Proof: Firstly, we prove $q_{\Phi} \geq \frac{B_{\Phi}^{*}-\varepsilon_{0} \phi\left(\varepsilon_{0}\right)}{B_{\Phi}^{*}-1}$. If $\Phi \notin \triangle_{2}(\infty)$, then $B_{\Phi}^{*}=\infty$, and the result is clear. If $\Phi \in \triangle_{2}(\infty)$, then $B_{\Phi}^{*}<\infty$. By the proof of Theorem 2.1, for $x \in L^{\Phi}[0,1]$ with $\|x\|_{\Phi}=1$, we have $\rho_{\Psi}\left(\phi\left(k_{x}^{*} x\right)\right) \geq 1$. So

$$
\begin{aligned}
1+\rho_{\Phi}\left(k_{x}^{*} x\right) & \leq \rho_{\Psi}\left(\phi\left(k_{x}^{*} x\right)\right)+\rho_{\Phi}\left(k_{x}^{*} x\right) \\
& =\int_{[0,1]} k_{x}^{*}|x(t)| \phi\left(k_{x}^{*}|x(t)|\right) d t \\
& \leq \int_{G_{1}=\left\{t: k_{x}^{*}|x(t)|<\varepsilon_{0}\right\}} \varepsilon_{0} \phi\left(\varepsilon_{0}\right) d t+\int_{G \backslash G_{1}} k_{x}^{*}|x(t)| \phi\left(k_{x}^{*}|x(t)|\right) d t \\
& <\varepsilon_{0} \phi\left(\varepsilon_{0}\right)+B_{\Phi}^{*} \rho_{\Phi}\left(k_{x}^{*} x\right) .
\end{aligned}
$$

Therefore

$$
1-\varepsilon_{0} \phi\left(\varepsilon_{0}\right) \leq\left(B_{\Phi}^{*}-1\right) \rho_{\Phi}\left(k_{x}^{*} x\right) .
$$

Noting that $\rho_{\Phi}\left(k_{x}^{*} x\right)=k_{x}^{*}-1$, we have

$$
\frac{1-\varepsilon_{0} \phi\left(\varepsilon_{0}\right)}{B_{\Phi}^{*}-1} \leq k_{x}^{*}-1
$$

i.e.

$$
k_{x}^{*} \geq \frac{B_{\Phi}^{*}-\varepsilon_{0} \phi\left(\varepsilon_{0}\right)}{B_{\Phi}^{*}-1}
$$

Since $x$ is arbitrary,

$$
q_{\Phi} \geq \frac{B_{\Phi}^{*}-\varepsilon_{0} \phi\left(\varepsilon_{0}\right)}{B_{\Phi}^{*}-1}
$$

Next we prove $Q_{\Phi} \leq \frac{A_{\Phi}^{*}\left(1+\Phi\left(\varepsilon_{0}\right)\right)}{A_{\Phi}^{*}-1}$. If $\Phi \notin \nabla_{2}(\infty)$, the result is obvious. If $\Phi \in \nabla_{2}(\infty)$, then $\forall x \in S\left(L^{\Phi}[0,1]\right), \forall k \in\left[k_{x}^{*}, k_{x}^{* *}\right]$ and $0<\varepsilon<1$, we get

$$
\begin{aligned}
1+\rho_{\Phi}[(k-\varepsilon) x] & \geq \rho_{\Psi}\{\phi[(k-\varepsilon)|x|]\}+\rho_{\Phi}[(k-\varepsilon) x] \\
& =\int_{[0,1]}(k-\varepsilon)|x(t)| \phi[(k-\varepsilon)|x(t)|] d t \\
& \geq \int_{\left\{t \in[0,1]:(k-\varepsilon)|x(t)| \geq \varepsilon_{0}\right\}}(k-\varepsilon)|x(t)| \phi[(k-\varepsilon)|x(t)|] d t \\
& \geq A_{\Phi}^{*} \int_{\left\{(k-\varepsilon)|x(t)| \geq \varepsilon_{0}\right\}} \Phi((k-\varepsilon)|x(t)|) d t \\
& =A_{\Phi}^{*}\left\{\rho_{\Phi}[(k-\varepsilon) x(t)]-\int_{\left\{t \in[0,1]:(k-\varepsilon)|x(t)|<\varepsilon_{0}\right\}} \Phi((k-\varepsilon) x(t)) d t\right\} \\
& \geq A_{\Phi}^{*}\left\{\rho_{\Phi}[(k-\varepsilon) x(t)]-\Phi\left(\varepsilon_{0}\right)\right\} .
\end{aligned}
$$

So

$$
1+A_{\Phi}^{*} \Phi\left(\varepsilon_{0}\right) \geq\left(A_{\Phi}^{*}-1\right) \rho((k-\varepsilon) x(t)) \geq\left(A_{\Phi}^{*}-1\right)(k-\varepsilon-1)
$$

i.e.

$$
k \leq \frac{A_{\Phi}^{*}\left[1+\Phi\left(\varepsilon_{0}\right)\right]}{A_{\Phi}^{*}-1}+\varepsilon
$$

Therefore,

$$
k \leq \frac{A_{\Phi}^{*}\left[1+\Phi\left(\varepsilon_{0}\right)\right]}{A_{\Phi}^{*}-1}
$$

Since $x \in S\left(L^{\Phi}[0,1]\right)$ is arbitrary,

$$
Q_{\Phi} \leq \frac{A_{\Phi}^{*}\left(1+\Phi\left(\varepsilon_{0}\right)\right)}{A_{\Phi}^{*}-1}
$$

Corollary 2.2 (S.T. Chen [1, p. 21]).
(i) If $\Phi \in \triangle_{2}(\infty)$, then $q_{\Phi}>1$.
(ii) If $\Phi \in \nabla_{2}(\infty)$, then $Q_{\Phi}<\infty$.

From the proof of Theorem 2.2, we know Theorem 2.2 is true for any $0<\varepsilon<\varepsilon_{0}$. Letting $\varepsilon$ to tend to 0 , we get

Corollary 2.3. Let $\Phi, \Psi$ be a pair of complementary $\mathcal{N}$-functions. Then

$$
\begin{equation*}
A_{\Psi}=\frac{B_{\Phi}}{B_{\Phi}-1} \leq q_{\Phi} \leq Q_{\Phi} \leq \frac{A_{\Phi}}{A_{\Phi}-1}=B_{\Psi} \tag{10}
\end{equation*}
$$

where $A_{\Phi}, B_{\Phi}, A_{\Psi}$ and $B_{\Psi}$ are defined by (1).
Example 1. For the $\mathcal{N}$-function $\Phi(u)=|u|^{p}$, which generates $L^{p}[0, \infty)$, we have $A_{\Phi}=B_{\Phi}=p$. By Theorem 2.1 and Corollary 2.3, we have $q_{\Phi}=Q_{\Phi}=\frac{p}{p-1}$.
Example 2. For the $\mathcal{N}$-function $\Phi(u)=e^{|u|}-|u|-1$, we have

$$
\begin{equation*}
1 \leq q_{\Phi} \leq Q_{\Phi} \leq 2 \tag{11}
\end{equation*}
$$

Indeed, $F_{\Phi}(t)=\frac{t\left(e^{t}-1\right)}{e^{t}-t-1}$ is increasing in $(0,+\infty)$. So $A_{\Phi}=\lim _{t \rightarrow 0^{+}} F_{\Phi}(t)=2$ and $B_{\Phi}=\lim _{t \rightarrow+\infty} F_{\Phi}(t)=\infty$. Therefore (11) follows from Theorem 2.1 and Corollary 2.3.
