# TANGENT LIFTS OF HIGHER ORDER OF MULTIPLICATIVE DIRAC STRUCTURES 

P. M. Kouotchop Wamba and A. Ntyam

#### Abstract

The tangent lifts of higher order of Dirac structures and some properties have been defined in [9] and studied in [11]. By the same way, the tangent lifts of higher order of Poisson structures have been studied in [10] and some applications are given. In particular, the authors have studied the nature of the Lie algebroids and singular foliations induced by these lifting. In this paper, we study the tangent lifts of higher order of multiplicative Poisson structures, multiplicative Dirac structures and we describe the Lie bialgebroid structures and the algebroid-Dirac structures induced by these prolongations.

## Introduction

We denote by $\mathcal{L G}$ and $\mathcal{L A}$ the categories of Lie groupoids and Lie algebroids, respectively. There is a natural functor $A: \mathcal{L G} \rightarrow \mathcal{L A}$, which maps each object $G \in \mathcal{L G}$ to the object $A G \in \mathcal{L} \mathcal{A}$, and every morphism of Lie groupoids $\phi: G_{1} \rightarrow G_{2}$ is mapped to the Lie algebroid morphism $A \phi: A G_{1} \rightarrow A G_{2}$. It is called the Lie functor and preserves the product bundles. Let $G$ be a Lie groupoid over a manifold $M$, we denote by $G_{(2)}$ the set of composable groupoid pairs and we recall that, a Poisson groupoid is a pair $\left(G ; \Pi_{G}\right)$ where $\Pi_{G}$ is a Poisson structure on $G$ which is multiplicative in the sense that the graph of the multiplication map

$$
\Lambda=\left\{(g, h, g h),(g, h) \in G_{(2)}\right\}
$$

is a coisotropic submanifold of $G \times G \times \bar{G}$, where $\bar{G}$ means that $G$ is equipped with the opposite Poisson structure. We say that the bivector $\Pi_{G}$ is a multiplicative bivector. On the other hand, it is well known that Lie bialgebroid is a

[^0]pair of Lie algebroids in duality $\left(E, E^{*}\right)$ satisfying
$$
d_{E^{*}}([u, v])=\left[d_{E^{*}}(u), v\right]+\left[u, d_{E^{*}}(v)\right]
$$
for any $u, v \in \Gamma(E)$. Here $d_{E^{*}}: \Gamma\left(\bigwedge^{k} E\right) \rightarrow \Gamma\left(\bigwedge^{k+1} E\right)$ denotes the Lie algebroid differential induced by $E^{*}$ and $[\cdot, \cdot]$ is the Schouten bracket on multisections of $E$. A classical example of a Lie bialgebroid is a Lie bialgebra. As a Lie bialgebras arise as the infinitesimal counterpart of Poisson-Lie groups, K. Mackenzie and P. Xu have shown that, the Lie bialgebroids are the infinitesimal version of Poisson groupoids (see [12]). More precisely, if $\left(G ; \Pi_{G}\right)$ is a Poisson groupoid, then $\left(A G, A^{*} G\right)$ is a Lie bialgebroid.

Let $G$ be a Lie groupoid over a manifold $M$, with Lie algebroid $A G$. The tangent bundle of order $r T^{r} G$ has a natural Lie groupoid structure over $T^{r} M$. This structure is obtained by applying the tangent functor of order $r$ to each of the structure maps defining $G$ (source, target, multiplication, inversion and identity section). In the particular case where $r=1$, we obtain the tangent Lie groupoid.

Consider now the cotangent bundle $T^{*} G$ over $G$, we know that $T^{*} G$ is a Lie groupoid over $A^{*} G$. The source and target maps are defined by:

$$
s^{*}\left(\gamma_{g}\right)(u)=\gamma_{g}\left(T L_{g}(u-T t(u))\right) \quad \text { and } \quad t^{*}\left(\delta_{g}\right)(v)=\delta_{g}\left(T R_{g}(v)\right)
$$

where $\gamma_{g} \in T_{g}^{*} G, u \in A_{s(g)} G$ and $\delta_{g} \in T_{g}^{*} G, v \in A_{t(g)} G$. The multiplication on $T^{*} G$ is defined by:

$$
\left(\beta_{g} \bullet \gamma_{h}\right)\left(X_{g} \bullet X_{h}\right)=\beta_{g}\left(X_{g}\right)+\gamma_{h}\left(X_{h}\right)
$$

for $\left(X_{g}, X_{h}\right) \in T_{(g, h)} G_{(2)}$. In [13], the author defines the cotangent Lie algebroid and proves that: There is a natural isomorphism of Lie algebroids

$$
j_{G}: A\left(T^{*} G\right) \rightarrow T^{*}(A G)
$$

such that the following diagram commutes

where $i_{A G}: A G \rightarrow T G$ is the natural injection and $\varepsilon_{G}: T T^{*} G \rightarrow T^{*} T G$ is the natural isomorphism of Tulczyjew. By this isomorphism, we identify $A\left(T^{*} G\right)$ with $T^{*}(A G)$. Let $(E, M, \pi)$ be a vector bundle, we denote by $\left(x^{i}, y^{j}\right)$ an
adapted coordinates system of $E$, it induces the local coordinates system

$$
\begin{array}{rll}
\left(x^{i}, \pi_{j}\right) & \text { in } & E^{*} \\
\left(x^{i}, y^{j}, p_{i}, \zeta_{j}\right) & \text { in } & T^{*} E
\end{array}
$$

and

$$
\left(x^{i}, \pi_{j}, p_{i}, \xi^{j}\right) \quad \text { in } \quad T^{*} E^{*}
$$

In [13], [12] is defined the natural submersion $r_{E}: T^{*} E \rightarrow E^{*}$ such that locally

$$
r_{E}\left(x^{i}, y^{j}, p_{i}, \zeta_{j}\right)=\left(x^{i}, \zeta_{j}\right)
$$

There exists a Legendre type map

$$
R_{E}: T^{*} E^{*} \rightarrow T^{*} E
$$

which is an anti-symplectomorphism with respect to the canonical symplectic structures on $T^{*} E^{*}$ and $T^{*} E$ respectively, and is locally defined by:

$$
R_{E}\left(x^{i}, \pi_{j}, p_{i}, \xi^{j}\right)=\left(x^{i}, y^{j},-p_{i}, \zeta_{j}\right)
$$

with

$$
\left\{\begin{array}{l}
y^{j}=\xi^{j} \\
\pi_{j}=\zeta_{j}
\end{array}\right.
$$

In this paper, we study the tangent lifts of higher order of multiplicative Poisson structures, multiplicative Dirac structures and we study some properties. In particular, we describe the structures of Dirac-algebroids induced by the tangent lifts of higher order of multiplicative Dirac structures. Thus, the main results are Propositions 3, 8 , Theorems 1 and 2
For the prolongations of functions, vector fields and differential forms, we adopt the same notations of [14. More precisely, for any $X \in \mathfrak{X}(M)$ and $\omega \in \Omega^{k}(M)$ we denote by $X^{(\alpha)}$ and $\omega^{(\alpha)}$ the $\alpha$-prolongations of $X$ and $\omega$ respectively. All geometric objects and maps are assumed to be infinitely differentiable. $r$ will be a natural integer $(r \geq 1)$.

## 1. Preliminaries

### 1.1. Some canonical transformations.

For each $\beta \in\{0, \ldots, r\}$, we denote by $\tau_{\beta}$ the canonical linear form on $J_{0}^{r}(\mathbb{R}, \mathbb{R})$ defined by:

$$
\tau_{\beta}\left(j_{0}^{r} g\right)=\left.\frac{1}{\beta!} \cdot \frac{d^{\beta}}{d t^{\beta}}(g(t))\right|_{t=0}, \quad \text { where } \quad g \in C^{\infty}(\mathbb{R}, \mathbb{R})
$$

For each manifold $M$, there is a canonical diffeomorphism (see [5], [8])

$$
\kappa_{M}^{r}: T^{r} T M \rightarrow T T^{r} M
$$

which is an isomorphism of vector bundles from

$$
T^{r}\left(\pi_{M}\right): T^{r} T M \rightarrow T^{r} M \quad \text { to } \quad \pi_{T^{r} M}: T T^{r} M \rightarrow T^{r} M
$$

It is called the canonical isomorphism of flow associated to the bundle functor $T^{r}$. Let $\left(x^{1}, \ldots, x^{m}\right)$ be a local coordinates system of $M$, we introduce a coordinates $\left(x^{i}, \dot{x}^{i}\right)$ in $T M,\left(x^{i}, \dot{x}^{i}, x_{\beta}^{i}, \dot{x}_{\beta}^{i}\right)$ in $T^{r} T M$ and $\left(x^{i}, x_{\beta}^{i}, \dot{x}^{i}, \dot{x_{\beta}^{i}}\right)$ in $T T^{r} M$. The local expression of $\kappa_{M}^{r}$ is given by:

$$
\kappa_{M}^{r}\left(x^{i}, \dot{x}^{i}, x_{\beta}^{i}, \dot{x}_{\beta}^{i}\right)=\left(x^{i}, x_{\beta}^{i}, \dot{x}^{i}, \dot{x}_{\beta}^{i}\right) \quad \text { with } \quad \dot{x}_{\beta}^{i}=\dot{x}_{\beta}^{i} .
$$

By the same way, there is a canonical diffeomorphism (see [1])

$$
\alpha_{M}^{r}: T^{*} T^{r} M \rightarrow T^{r} T^{*} M
$$

which is an isomorphism of vector bundles

$$
\pi_{T^{r} M}^{*}: T^{*} T^{r} M \rightarrow T^{r} M \quad \text { and } \quad T^{r}\left(\pi_{M}^{*}\right): T^{r} T^{*} M \rightarrow T^{r} M
$$

dual of $\kappa_{M}^{r}$ with respect to pairings $\langle\cdot, \cdot\rangle_{T^{r} M}^{\prime}=\tau_{r} \circ T^{r}\left(\langle\cdot, \cdot\rangle_{M}\right)$ and $\langle\cdot, \cdot\rangle_{T^{r} M}$, i.e. for any $\left(u, u^{*}\right) \in T^{r} T M \oplus T^{*} T^{r} M$,

$$
\begin{equation*}
\left\langle\kappa_{M}^{r}(u), u^{*}\right\rangle_{T^{r} M}=\left\langle u, \alpha_{M}^{r}\left(u^{*}\right)\right\rangle_{T^{r} M}^{\prime} \tag{1.1}
\end{equation*}
$$

Let $\left(x^{1}, \ldots, x^{m}\right)$ be a local coordinates system of $M$, we introduce the coordinates $\left(x^{i}, p_{j}\right)$ in $T^{*} M,\left(x^{i}, p_{j}, x_{\beta}^{i}, p_{j}^{\beta}\right)$ in $T^{r} T^{*} M$ and $\left(x^{i}, x_{\beta}^{i}, \pi_{j}, \pi_{j}^{\beta}\right)$ in $T^{*} T^{r} M$. We have:

$$
\alpha_{M}^{r}\left(x^{i}, \pi_{j}, x_{\beta}^{i}, \pi_{j}^{\beta}\right)=\left(x^{i}, x_{\beta}^{i}, p_{j}, p_{j}^{\beta}\right)
$$

with

$$
\left\{\begin{array}{l}
p_{j}=\pi_{j}^{r} \\
p_{j}^{\beta}=\pi_{j}^{r-\beta}
\end{array}\right.
$$

By $\varepsilon_{M}^{r}$ we denote the map $\left(\alpha_{M}^{r}\right)^{-1}$.
Remark 1. In the particular case where $r=1$, the canonical isomorphism $\alpha_{M}^{1}: T^{*} T M \rightarrow T T^{*} M$ coincides with the canonical isomorphism of Tulczyjew.

### 1.2. Tangent lifts of higher order of Poisson manifolds.

We recall that in [10], it is defined for each integer $q \geq 1$, the natural transformations

$$
\begin{equation*}
\kappa^{r, q}: T^{r} \circ\left(\bigwedge^{q} T\right) \rightarrow \bigwedge^{q} T \circ T^{r} \tag{1.2}
\end{equation*}
$$

such that, for each manifold $M$ of dimension $m$, we have locally:

$$
\begin{equation*}
\kappa_{M}^{r, q}\left(x_{\alpha}^{i}, \Pi_{\alpha}^{i_{1} \ldots i_{q}}\right)=\left(x_{\alpha}^{i}, \widetilde{\Pi}^{i_{1}, \alpha_{1} \ldots i_{q}, \alpha_{q}}\right) \tag{1.3}
\end{equation*}
$$

with

$$
\begin{equation*}
\widetilde{\Pi}^{i_{1}, \alpha_{1} \ldots i_{q}, \alpha_{q}}=\sum_{\gamma_{1}+\cdots+\gamma_{q}+\beta=r} \delta_{\alpha_{1}}^{r-\gamma_{1}} \ldots \delta_{\alpha_{q}}^{r-\gamma_{q}} \Pi_{\beta}^{i_{1} \ldots i_{q}} \tag{1.4}
\end{equation*}
$$

Let $\Pi$ be a multivector field of degree $q$ on $M$. We put

$$
\begin{equation*}
\Pi^{(c)}=\kappa_{M}^{r, q} \circ T^{r} \Pi: T^{r} M \rightarrow \bigwedge^{q} T T^{r} M \tag{1.5}
\end{equation*}
$$

$\Pi^{(c)}$ is a multivector field of degree $q$ on $T^{r} M$. Therefore, if locally

$$
\Pi=\sum_{1 \leq i_{1}<\cdots<i_{q} \leq m} \Pi^{i_{1} \ldots i_{q}} \frac{\partial}{\partial x^{i_{1}}} \wedge \cdots \wedge \frac{\partial}{\partial x^{i_{q}}}
$$

then, we have

$$
\begin{equation*}
\Pi^{(c)}=\sum_{\alpha_{1}+\cdots+\alpha_{q}+\mu=r}\left(\Pi^{i_{1} \ldots i_{q}}\right)^{(\mu)} \frac{\partial}{\partial x_{r-\alpha_{1}}^{i_{1}}} \wedge \cdots \wedge \frac{\partial}{\partial x_{r-\alpha_{q}}^{i_{q}}} \tag{1.6}
\end{equation*}
$$

In the particular case where $q=2$, and $\Pi=\Pi^{i j} \frac{\partial}{\partial x^{i}} \wedge \frac{\partial}{\partial x^{j}}$ we have:

$$
\begin{equation*}
\Pi^{(c)}=\left(\Pi^{i j}\right)^{(\alpha+\beta-r)} \frac{\partial}{\partial x_{\alpha}^{i}} \wedge \frac{\partial}{\partial x_{\beta}^{j}} . \tag{1.7}
\end{equation*}
$$

For a simple $k$-vector field of $\Pi=X_{1} \wedge \cdots \wedge X_{k}$ with $X_{1}, \ldots, X_{k} \in \mathfrak{X}(M)$, we have

$$
\begin{equation*}
\Pi^{(c)}=\sum_{\beta_{1}+\cdots+\beta_{k}=r} X_{1}^{\left(r-\beta_{1}\right)} \wedge \cdots \wedge X_{k}^{t\left(r-\beta_{k}\right)} \tag{1.8}
\end{equation*}
$$

Using the equation (1.8), we prove in [10] the following equality, for any $\Phi \in \mathfrak{X}^{p}(M)$ and $\Psi \in \mathfrak{X}^{q}(M)$, we have:

$$
\begin{equation*}
\left[\Phi^{(c)}, \Psi^{(c)}\right]=[\Phi, \Psi]^{(c)} \tag{1.9}
\end{equation*}
$$

Thus, if $\left(M, \Pi_{M}\right)$ is a Poisson manifold then, the pair $\left(T^{r} M, \Pi_{M}^{(c)}\right)$ is also a Poisson manifold. This structure is called the tangent lift of order $r$ of Poisson structure.

Proposition 1. Let $\left(M, \Pi_{M}\right)$ be a Poisson manifold. We denote by $\sharp_{\Pi_{M}}$ the anchor map induced by $\Pi_{M}$. We have the following formula

$$
\begin{equation*}
\sharp_{\Pi_{M}^{(c)}}^{(c)}=\kappa_{M}^{r} \circ T^{r}\left(\sharp_{\Pi_{M}}\right) \circ \alpha_{M}^{r} . \tag{1.10}
\end{equation*}
$$

Proof. See [10].
For some properties of the Poisson manifold $\left(T^{r} M, \Pi_{M}^{(c)}\right)$ see [10]. however, these fundamental properties come from the formula:

$$
i_{\Pi_{M}^{(c)}} \omega^{(r-\alpha)}=\left(i_{\Pi_{M}} \omega\right)^{(\alpha)}
$$

where $\omega \in \Omega^{1}(M)$ and $\alpha \in\{0,1, \ldots, r\}$.

### 1.3. Tangent lifts of higher order of Lie algebroids.

For any vector bundle $(E, M, \pi)$, we consider the natural vector bundle morphism

$$
\chi_{E}^{(\alpha)}: T^{r} E \rightarrow T^{r} E
$$

defined for each $j_{0}^{r} \varphi \in T^{r} E$ by:

$$
\chi_{E}^{(\alpha)}\left(j_{0}^{r} \varphi\right)=j_{0}^{r}\left(t^{\alpha} \varphi\right)
$$

Let $u \in \Gamma(E)$, we define the section $u^{(\alpha)}$ of $\left(T^{r} E, T^{r} M, T^{r} \pi\right)$ by:

$$
u^{(\alpha)}=\chi_{E}^{(\alpha)} \circ T^{r} u, \quad 0 \leq \alpha \leq r .
$$

$u^{(\alpha)}$ is called $\alpha$-prolongation of the section $u$ (see [5] or [16]).
We suppose that $E$ is a Lie algebroid over $M$ of anchor map $\rho$. In 10, we have shown that: it exists one and only one Lie algebroid structure on $T^{r} E$, of anchor $\operatorname{map} \rho^{(r)}=\kappa_{M}^{r} \circ T^{r} \rho$ such that: for any $u, v \in \Gamma(E)$ and $\alpha, \beta \in\{0, \ldots, r\}$ we have:

$$
\begin{equation*}
\left[u^{(\alpha)}, v^{(\beta)}\right]=[u, v]^{(\alpha+\beta)} . \tag{1.11}
\end{equation*}
$$

This Lie algebroid structure is called tangent lift of order $r$ of Lie algebroid $(E,[\cdot, \cdot], \rho)$. For some properties of the Lie algebroid $\left(T^{r} E,[\cdot, \cdot], \rho^{(r)}\right)$, see 10. In particular for $r=1$, we obtain the tangent lift of Lie algebroid $(E,[\cdot, \cdot], \rho)$ defined in (4).
For $s \in\{1, \ldots, r\}$, we consider the natural projection $\pi_{E}^{r, s}: T^{r} E \rightarrow T^{s} E$ defined by:

$$
\pi_{E}^{r, s}\left(j_{0}^{r} \varphi\right)=j_{0}^{s} \varphi
$$

For any $u \in \Gamma(E)$ and natural number $\alpha \leq r$, we have:

$$
\pi_{E}^{r, s}\left(u^{(\alpha)}\right)=\left\{\begin{array}{lll}
u^{(\alpha)} & \text { if } & \alpha \leq s  \tag{1.12}\\
0 & \text { if } & \alpha>s
\end{array}\right.
$$

In this case, we have the following result:

Proposition 2. The vector bundle projection $\pi_{E}^{r, s}: T^{r} E \rightarrow T^{s} E$ is a morphism of Lie algebroids over $\pi_{M}^{r, s}: T^{r} M \rightarrow T^{s} M$.
Proof. The property of compatibility of Lie bracket between $\Gamma\left(T^{r} E\right)$ and $\Gamma\left(T^{s} E\right)$ is obtained by the formula 1.12 . Since, for any $u \in \Gamma(E)$ and $\alpha \in\{0, \ldots, r\}$,

$$
\begin{aligned}
T\left(\pi_{M}^{r, s}\right) \circ \rho^{(r)}\left(u^{(\alpha)}\right) & =T\left(\pi_{M}^{r, s}\right) \circ[\rho(u)]^{(\alpha)} \\
& =T\left(\pi_{M}^{r, s}\right) \circ\left(\kappa_{M}^{r} \circ \chi_{T M}^{(\alpha)} \circ T^{r}[\rho(u)]\right) \\
& =\kappa_{M}^{s} \circ \pi_{T M}^{r, s}\left(j_{0}^{r}\left(t^{\alpha}[\rho(u)]\right)\right) \\
& =\rho^{(s)} \circ \pi_{A}^{r, s}\left(u^{(\alpha)}\right)
\end{aligned}
$$

we deduce that, the projection $\pi_{E}^{r, s}: T^{r} E \rightarrow T^{s} E$ is a morphism of Lie algebroids over $\pi_{M}^{r, s}$.
Remark 2. In the particular case where $s=1$, the bundle projection $\pi_{E}^{r, 1}: T^{r} E \rightarrow T E$ is a morphism of Lie algebroids over $\pi_{M}^{r, 1}: T^{r} M \rightarrow T M$. In [12], it is shown that, the bundle map (tangent projection) $\tau_{E}: T E \rightarrow E$ is a morphism of Lie algebroids over $\tau_{M}: T M \rightarrow M$, therefore we have:
Corollary 1. The vector bundle projection $\tau_{E}^{r}: T^{r} E \rightarrow E$ is a morphism of Lie algebroids over $\tau_{M}^{r}: T^{r} M \rightarrow M$.

Let $(E, M, \pi)$ be a vector bundle. Consider the canonical pairing $E^{*} \times_{M}$ $E \rightarrow \mathbb{R}$. Applying the tangent functor of order $r$ and projecting onto the $(r+1)$-component, we get a non degenerate pairing $T^{r} E^{*} \times_{T^{r} M} T^{r} E \rightarrow \mathbb{R}$. We use this pairing to define an isomorphism of vector bundles

$$
\begin{equation*}
I_{E}^{r}: T^{r} E^{*} \rightarrow\left(T^{r} E\right)^{*} \tag{1.13}
\end{equation*}
$$

Theorem 1. Let $(E,[\cdot, \cdot], \rho)$ be a Lie algebroid. The natural vector bundle

$$
\alpha_{E}^{r}: T^{*} T^{r} E \rightarrow T^{r} T^{*} E
$$

is an isomorphism of Lie algebroids over the canonical isomorphism $I_{E}^{r}$.
Proof. As $E$ is a Lie algebroid, it follows that $E^{*}$ has a Poisson structure. Therefore, the vector bundle morphism $\alpha_{E^{*}}^{r}: T^{*} T^{r} E^{*} \rightarrow T^{r} T^{*} E^{*}$ is an isomorphism of Lie algebroids (see [10]). The rest of the proof comes from the commutative diagram

$$
\begin{aligned}
T^{*} T^{r} E^{*} \xrightarrow{\alpha_{E^{*}}^{r}} T^{r} T^{*} E^{*} \\
\widehat{R}_{T^{r} E} \downarrow \\
T^{*} T^{r} E \xrightarrow[\alpha_{E}^{r}]{\longrightarrow} T^{r} T^{*} E
\end{aligned}
$$

Where $R_{E}: T^{*} E^{*} \rightarrow T^{*} E$ is the Legendre map and $\widehat{R}_{T^{r} E}=R_{T^{r} E} \circ T^{*}\left(\left(I_{E}^{r}\right)^{-1}\right)$.
Let $(G \rightrightarrows M)$ be a Lie groupoid. The vector bundle morphism $\kappa_{G}^{r}: T^{r} T G \rightarrow$ $T T^{r} G$ is an isomorphism of Lie groupoids. So, it induces the isomorphism of vector bundles

$$
\begin{equation*}
j_{G}^{r}: T^{r}(A G) \rightarrow A\left(T^{r} G\right) \tag{1.14}
\end{equation*}
$$

such that, the following diagram commutes

In [7], it is defined the natural isomorphism (1.14) by the replacement of tangent functor of order $r$, by any Weil functor.

## 2. Tangent lifts of higher order of Lie bialgebroids AND SOME PROPERTIES

### 2.1. Lifting of Lie bialgebroids.

Proposition 3. Let $\left(A, A^{*}\right)$ be a Lie bialgebroid. The pair $\left(T^{r} A,\left(T^{r} A\right)^{*}\right)$ has a canonical structure of Lie bialgebroid.

Proof. It is well-know that, if $\left(A, A^{*}\right)$ is a pair of Lie algebroids and $\Pi_{A}$ be a linear Poisson bivector on $A$ defined by the Lie algebroid $A^{*}$, then $\left(A, A^{*}\right)$ is a Lie bialgebroids if and only if

$$
T \pi \circ \sharp_{\Pi_{A}}=\rho_{A^{*}} \circ r_{A} .
$$

Since $A$ and $A^{*}$ are the Lie algebroids, it follows that $T^{r} A$ and $T^{r} A^{*}$ are also Lie algebroids. The structure of Lie algebroid of $\left(T^{r} A\right)^{*}$ is such that the map $I_{A}^{r}: T^{r} A^{*} \rightarrow\left(T^{r} A\right)^{*}$ is an isomorphism of Lie algebroids. In this case, we have two structures of Poisson manifolds $\Pi_{A}^{(c)}$ and $\Pi_{T^{r} A}$ on $T^{r} A$. By calculation in local coordinates, we deduce that $\Pi_{A}^{(c)}=\Pi_{T^{r} A}$. In fact, let $\left(u_{i}\right)_{i=1 \ldots, n}$ be a basis of sections of $A^{*}$ the local expression of Lie bracket of sections and anchor map are given by:

$$
\left[u_{i}, u_{j}\right]=c_{i j}^{k} u_{k} \quad \text { and } \quad \rho_{A^{*}}\left(u_{j}\right)=\rho_{j}^{i} \frac{\partial}{\partial x^{i}}
$$

So, the Poisson bivector on $A$ induced by a Lie algebroid $A^{*}$ is such that:

$$
\Pi_{A}=\frac{1}{2} c_{i j}^{k} y_{k} \frac{\partial}{\partial y_{i}} \wedge \frac{\partial}{\partial y_{j}}+\rho_{j}^{i} \frac{\partial}{\partial x^{i}} \wedge \frac{\partial}{\partial y_{j}} .
$$

The structure of tangent lift of higher order of Lie algebroid on $T^{r} A^{*}$ is given by:

$$
\left[u_{i}^{(\alpha)}, u_{j}^{(\beta)}\right]=\left(c_{i j}^{k}\right)^{(\gamma)} u_{k}^{(\alpha+\beta+\gamma)}
$$

We put $u_{. i}^{(\alpha)}=I_{A}^{r}\left(u_{i}^{(r-\alpha)}\right)$. It follows that the Lie bracket of sections of $\left(T^{r} A\right)^{*}$ is given by:

$$
\left[u_{\cdot i}^{(\alpha)}, u_{\cdot j}^{(\beta)}\right]=\left(c_{i j}^{k}\right)^{(\gamma)} u_{\cdot k}^{(\alpha+\beta-\gamma-r)} .
$$

The Poisson structure on $T^{r} A$ is such that:

$$
\begin{aligned}
\Pi_{T^{r} A} & =\frac{1}{2}\left(c_{i j}^{k}\right)^{(\alpha+\beta-\gamma-r)} y_{k}^{\gamma} \frac{\partial}{\partial y_{i}^{\alpha}} \wedge \frac{\partial}{\partial y_{j}^{\beta}}+\left(\rho_{j}^{i}\right)^{(\alpha+\beta-r)} \frac{\partial}{\partial x_{\alpha}^{i}} \wedge \frac{\partial}{\partial y_{j}^{\beta}} \\
& =\frac{1}{2}\left(c_{i j}^{k} y_{k}\right)^{(\alpha+\beta-r)} \frac{\partial}{\partial y_{i}^{\alpha}} \wedge \frac{\partial}{\partial y_{j}^{\beta}}+\left(\rho_{j}^{i}\right)^{(\alpha+\beta-r)} \frac{\partial}{\partial x_{\alpha}^{i}} \wedge \frac{\partial}{\partial y_{j}^{\beta}} \\
& =\Pi_{A}^{(c)}
\end{aligned}
$$

Thus, $\Pi_{T^{r} A}=\Pi_{A}^{(c)}$. By the following commutative diagram

we deduce that, the diagram

commutes. Where $\rho_{\left(T^{r} A\right)^{*}}=\rho_{A^{*}}^{(r)} \circ\left(I_{A}^{r}\right)^{-1}$. We deduce that the pair $\left(T^{r} A,\left(T^{r} A\right)^{*}\right)$ is a Lie bialgebroid (see the theorem of Mackenzie and Xu in [12]).

Remark 3. (i) The Lie algebroids $\left(T^{r} A\right)^{*}$ and $T^{r} A^{*}$ are naturally equivalent by the isomorphism of vector bundles $\left(I_{A}^{r}\right)^{-1}$.
(ii) When $\left(\mathfrak{g}, \mathfrak{g}^{*}\right)$ is a Lie bialgebra then, $\left(T^{r} \mathfrak{g},\left(T^{r} \mathfrak{g}\right)^{*}\right)$ is a Lie bialgebra.

Let $\left(A, A^{*}\right)$ be a Lie bialgebroid, the composition $\rho_{A^{*}} \circ \rho_{A}^{*}: T^{*} M \rightarrow T M$ defines a Poisson structure on $M$ of bivector $\Pi_{A, A^{*}}$. Therefore, we have $\sharp_{\Pi_{A, A^{*}}}=$ $\rho_{A^{*}} \circ \rho_{A}^{*}$.

Corollary 2. Let $\left(A, A^{*}\right)$ be a Lie bialgebroid. The Poisson bivector on $T^{r} M$ induced by the Lie bialgebroid $\left(T^{r} A,\left(T^{r} A\right)^{*}\right)$ is the complete lift of order $r$ of the Poisson bivector $\Pi_{A, A^{*}}$. For further details, we have:

$$
\Pi_{T^{r} A,\left(T^{r} A\right)^{*}}=\Pi_{A, A^{*}}^{(c)}
$$

Proof. The anchor maps of $T^{r} A$ and $\left(T^{r} A\right)^{*}$ are given by: $\rho_{A}^{(r)}=\kappa_{M}^{r} \circ T^{r} \rho_{A}$ and $\rho_{\left(T^{r} A\right)^{*}}=\kappa_{M}^{r} \circ T^{r} \rho_{A^{*}} \circ\left(I_{A}^{r}\right)^{-1}$. By the formulas

$$
\begin{aligned}
\left(I_{A}^{r}\right)^{-1} \circ\left(T^{r} \rho_{A}\right)^{*} & =T^{r}\left(\rho_{A}^{*}\right) \circ\left(I_{T M}^{r}\right)^{-1} \\
\left(I_{T M}^{r}\right)^{-1} \circ\left(\kappa_{M}^{r}\right)^{*} & =\alpha_{M}^{r}
\end{aligned}
$$

we have:

$$
\begin{aligned}
\sharp_{\Pi_{T^{r} A\left(T^{r} A\right)^{*}}} & =\kappa_{M}^{r} \circ T^{r} \rho_{A^{*}} \circ\left(I_{A}^{r}\right)^{-1} \circ\left(\kappa_{M}^{r} \circ T^{r} \rho_{A}\right)^{*} \\
& =\kappa_{M}^{r} \circ T^{r} \rho_{A^{*}} \circ\left(I_{A}^{r}\right)^{-1} \circ\left(T^{r} \rho_{A}\right)^{*} \circ\left(\kappa_{M}^{r}\right)^{*} \\
& =\kappa_{M}^{r} \circ T^{r}\left(\rho_{A^{*}} \circ \rho_{A}^{*}\right) \circ \alpha_{M}^{r} \\
& =\kappa_{M}^{r} \circ T^{r}\left(\sharp_{\Pi_{A, A^{*}}}\right) \circ \alpha_{M}^{r} \\
& =\sharp_{\Pi_{A, A^{*}}^{(c)}}
\end{aligned}
$$

### 2.2. Tangent lifts of higher order of multiplicative Poisson manifolds.

Let $G$ be a Lie groupoid over $M, A G$ denote the Lie algebroid of Lie groupoid $G$ and $A^{*}(G)$ his dual. In [12], it is known that a bivector $\Pi_{G} \in \Gamma\left(\bigwedge^{2} T G\right)$ is a multiplicative bivector if and only if

is a morphism of Lie groupoids over the vector bundle map $\rho_{A^{*}(G)}$.

Theorem 2. Let $\left(G, \Pi_{G}\right)$ be a multiplicative Poisson manifold on a Lie groupoid $G$ over $M$. The pair $\left(T^{r} G, \Pi_{G}^{(c)}\right)$ is a multiplicative Poisson manifold on the Lie groupoid $T^{r} G$ over $T^{r} M$.

Proof. We put $\gamma_{A G}^{r}=\left(I_{A(G)}^{r}\right)^{-1} \circ\left(j_{G}^{r}\right)^{*}$, we have the following commutative diagram

we deduce that the diagram

commutes, where $\rho_{A^{*}\left(T^{r} G\right)}=\left(I_{A(G)}^{r}\right)^{-1} \circ\left(j_{G}^{r}\right)^{*} \circ \rho_{A^{*}(G)}^{(r)}$. We deduce that $\left(T^{r} G, \Pi_{G}^{(c)}\right)$ is a multiplicative Poisson manifold on the Lie groupoid $T^{r} G$ over $T^{r} M$.

Corollary 3. Let $\left(G, \Pi_{G}\right)$ be a multiplicative Poisson manifold. There is a natural isomorphism of Lie bialgebroids between the Lie bialgebroid ( $A\left(T^{r} G\right)$, $\left.A^{*}\left(T^{r} G\right)\right)$ of the Poisson groupoid $\left(T^{r} G, \Pi_{G}^{(c)}\right)$ and the Lie bialgebroid ( $T^{r}(A G)$, $\left.\left(T^{r}(A G)\right)^{*}\right)$.

Proof. In [12], it is shown that the diagram

commutes. By the equalities

$$
\begin{aligned}
T^{r}\left(\left(j_{G}^{1}\right)^{-1}\right) \circ T^{r} A\left(\sharp_{\Pi_{G}}\right) & =T^{r}\left(\sharp_{\Pi_{A G}}\right) \circ T^{r}\left(j_{G}\right) \\
\kappa_{A G}^{r} \circ T^{r}\left(\sharp_{\Pi_{A G}}\right) & =\sharp_{\Pi_{A G}^{(c)}} \circ \varepsilon_{A G}^{r} \\
T\left(j_{G}^{r}\right) \circ \sharp_{\Pi_{A G}^{(c)}} & =\sharp_{\Pi_{A\left(T^{r} G\right)}} \circ T^{*}\left(\left(j_{G}^{r}\right)^{-1}\right) \\
j_{A\left(T^{r} G\right)}^{1} \circ \sharp_{\Pi_{A\left(T^{r} G\right)}} & =A\left(\sharp_{\Pi_{G}^{(c)}}\right) \circ j_{G}^{-1} .
\end{aligned}
$$

It follows that the diagram

commutes. So, the Lie bialgebroid $\left(T^{r}(A G),\left(T^{r}(A G)\right)^{*}\right)$ is the Lie bialgebroid induced by the Poisson groupoid $\left(T^{r} G, \Pi_{G}^{(c)}\right)$.
Remark 4. If $\left(G, \Pi_{G}\right)$ is a Poisson-Lie group then, $\left(T^{r} G, \Pi_{G}^{(c)}\right)$ is a Poisson-Lie group. The Lie bialgebra defined by $\left(T^{r} G, \Pi_{G}^{(c)}\right)$, is the Lie bialgebra $\left(T^{r} \mathfrak{g}\right.$, $\left.\left(T^{r} \mathfrak{g}\right)^{*}\right)$, where $\left(\mathfrak{g}, \mathfrak{g}^{*}\right)$ is the Lie bialgebra of $\left(G, \Pi_{G}\right)$.

## 3. Multiplicative Dirac structures of higher order

### 3.1. Tangent lifts of higher order of Dirac structures.

Let $\left(M, L_{M}\right)$ be an almost Dirac structure. We set

$$
\begin{equation*}
L_{T^{r} M}=\left(\kappa_{M}^{r} \oplus \varepsilon_{M}^{r}\right)\left(T^{r} L_{M}\right) \subset T T^{r} M \oplus T^{*} T^{r} M \tag{3.1}
\end{equation*}
$$

$L_{T^{r} M}$ is an almost Dirac structure on $T^{r} M$.
By the formula (3.1), we deduce that: for any $S=X \oplus \omega \in \Gamma\left(L_{M}\right)$ and $\beta \in\{0, \ldots, r\}$,

$$
\begin{equation*}
\left(\kappa_{M}^{r} \oplus \varepsilon_{M}^{r}\right)\left(S^{(\beta)}\right)=X^{(\beta)} \oplus \omega^{(r-\beta)} \tag{3.2}
\end{equation*}
$$

is a section of vector bundle $L_{T^{r} M}$.
The integrability of an almost Dirac structure $\left(M, L_{M}\right)$ is measured by the Courant 3 -tensor $T_{L_{M}}$ defined by:

$$
\begin{aligned}
T_{L_{M}}: \Gamma\left(L_{M}\right) \times \Gamma\left(L_{M}\right) \times \Gamma\left(L_{M}\right) & \rightarrow C^{\infty}(M) \\
\left(S_{1}, S_{2}, S_{3}\right) & \mapsto\left\langle\left[S_{1}, S_{2}\right], S_{3}\right\rangle_{+}
\end{aligned}
$$

where $[\cdot, \cdot]$ is the Courant bracket defined on $\mathfrak{X}(M) \oplus \Omega^{1}(M)$. In fact, an almost Dirac structure $L_{M} \subset T M \oplus T^{*} M$ defines a Dirac structure if and only if the Courant tensor $T_{L_{M}}$ vanishes.
Proposition 4. $\overline{T_{L_{M}}}{ }^{(c)}$ is a complete lift of 3-tensor $T_{L_{M}}$ from $L_{M}$ to $T^{r} L_{M}$ (see [2]). We have:

$$
\begin{equation*}
\overline{T_{L_{M}}}{ }^{(c)}=T_{L_{T^{r} M}} \circ\left(\bigoplus^{3}\left(\kappa_{M}^{r} \oplus \varepsilon_{M}^{r}\right)\right) \tag{3.3}
\end{equation*}
$$

Proof. See 11.
By this result, we deduce that an almost Dirac structure $\left(M, L_{M}\right)$ is integrable if and only if ( $T^{r} M, L_{T^{r} M}$ ) is integrable.

Let $f: M \rightarrow N$ be a smooth map. The elements $X \oplus \omega \in \mathfrak{X}(M) \oplus \Omega^{1}(M)$ and $Y \oplus \varpi \in \mathfrak{X}(N) \oplus \Omega^{1}(N)$ are $f$-related if $Y=T f(X)$ and $T^{*} f(\varpi)=\omega$.

Proposition 5. Let $\left(M, L_{M}\right)$ and $\left(N, L_{N}\right)$ the Dirac manifolds. If $f: M \rightarrow N$ is a backward (resp. forward) Dirac map then,

$$
T^{r} f:\left(T^{r} M, L_{T^{r} M}\right) \rightarrow\left(T^{r} N, L_{T^{r} N}\right)
$$

is a backward (resp. forward) Dirac map.
Proof. We recall that, $f$ is a backward Dirac map if and only if, the $C^{\infty}(N)$-module $\Gamma\left(L_{N}\right)$ is the space of all $f$-related sections to sections of $\Gamma\left(L_{M}\right)$. The remainder of proof comes from the fact that, if $X \oplus \omega$ and $Y \oplus \varpi$ are $f$-related then, for any $\alpha=0, \cdots, r, X^{(\alpha)} \oplus \omega^{(r-\alpha)}$ and $Y^{(\alpha)} \oplus \varpi^{(r-\alpha)}$ are $T^{r} f$-related and the spaces $\Gamma\left(L_{T^{r} M}\right), \Gamma\left(L_{T^{r} N}\right)$ are generated by the sets $\left\{X^{(\alpha)} \oplus \omega^{(r-\alpha)}, X \oplus \omega \in \Gamma\left(L_{M}\right)\right\}$ and $\left\{Y^{(\alpha)} \oplus \varpi^{(r-\alpha)}, Y \oplus \varpi \in \Gamma\left(L_{N}\right)\right\}$ respectively. When $f$ is a forward Dirac map, we have the same proof.

Remark 5. We denote by $\mathcal{D} \mathcal{M}$ the category of Dirac manifolds and Dirac maps. By the Proposition 5. we have the natural functor which send an object $\left(M, L_{M}\right)$ to the tangent object of higher order $\left(T^{r} M, L_{T^{r} M}\right)$, and a Dirac morphism $f:\left(M, L_{M}\right) \rightarrow\left(N, L_{N}\right)$ to the tangent morphism of higher order $T^{r} f:\left(T^{r} M, L_{T^{r} M}\right) \rightarrow\left(T^{r} N, L_{T^{r} N}\right)$. This functor is denoted by $\mathcal{T}^{r}: \mathcal{D M} \rightarrow \mathcal{D M}$.

### 3.2. Tangent lifts of higher order of multiplicative Dirac structures.

Definition 1. Let $G$ be a Lie groupoid over the manifold $M$. A Dirac structure $L_{G}$ on $G$ is said to be multiplicative if $L_{G} \subset T G \oplus T^{*} G$ is a sub groupoid over some sub bundle $E$ of $T M \oplus A^{*}(G)$.

Example 1. Let $\left(G, \Pi_{G}\right)$ be a Poisson groupoid. The multiplication of $\Pi_{G}$ is equivalent to saying that $\sharp_{\Pi_{G}}: T^{*} G \rightarrow T G$ is a morphism of Lie groupoids. Therefore, the sub bundle $L_{\Pi_{G}}=\operatorname{graph}\left(\sharp_{\Pi_{G}}\right) \subset T G \oplus T^{*} G$ defines a multiplicative Dirac structure over the sub bundle $E \subset T M \oplus A^{*}(G)$, where $E$ is the graph of dual anchor map $\rho_{A^{*}(G)}: A^{*}(G) \rightarrow T M$.

Proposition 6. Let $L_{G} \subset T G \oplus T^{*} G$ be a multiplicative Dirac structure on a Lie groupoid G. The tangent Dirac structure of higher order $L_{T^{r} G} \subset$ $T T^{r} G \oplus T^{*} T^{r} G$ is also a multiplicative Dirac structure on a Lie groupoid $\left(T^{r} G \rightrightarrows T^{r} M\right)$.

Proof. The map $\kappa_{G}^{r}: T^{r} T G \rightarrow T T^{r} G$ is an isomorphism of Lie groupoids over $\kappa_{M}^{r}: T^{r} T M \rightarrow T T^{r} M$. By the same way, the bundle $\varepsilon_{G}^{r}: T^{r} T^{*} G \rightarrow T^{*} T^{r} G$ is an isomorphism of Lie groupoids over $\left(\left(j_{G}^{r}\right)^{*}\right)^{-1} \circ I_{A G}^{r}: T^{r}\left(A^{*} G\right) \rightarrow A^{*}\left(T^{r} G\right)$. Since $L_{G}$ is a Lie sub groupoid of $T G \oplus T^{*} G$, then $T^{r} L_{G}$ is a Lie sub groupoid of $T^{r} T G \oplus T^{r} T^{*} G$ over the sub bundle $T^{r} E$. By the groupoid isomorphism $\kappa_{G}^{r} \oplus \varepsilon_{G}^{r}: T^{r} T G \oplus T^{r} T^{*} G \rightarrow T T^{r} G \oplus T^{*} T^{r} G$, we deduce that $L_{T^{r} G}=\left(\kappa_{G}^{r} \oplus\right.$ $\left.\varepsilon_{G}^{r}\right)\left(T^{r} L_{G}\right)$ is a Lie sub groupoid of $T T^{r} G \oplus T^{*} T^{r} G$ over the sub bundle $\mathcal{T}^{r} E=\left(\kappa_{M}^{r} \oplus\left(\left(\left(j_{G}^{r}\right)^{*}\right)^{-1} \circ I_{A G}^{r}\right)\right)\left(T^{r} E\right) \subset T T^{r} M \oplus A^{*}\left(T^{r} G\right)$. Hence we conclude that $L_{T^{r} G}$ is a multiplicative Dirac structure on $\left(T^{r} G \rightrightarrows T^{r} M\right)$.

Remark 6. In the particular case where $G$ is a Lie group, the tangent Dirac structure of higher order $L_{G}$ is a Dirac structure on the Lie group $T^{r} G$.

### 3.3. Tangent lifts of higher order of linear Dirac structures.

Let $(E, M, \pi)$ be a vector bundle. We consider the double vector bundle structures $(T E, T M, E, M),\left(T^{*} E, E^{*}, E, M\right)$ and $\left(T E \oplus T^{*} E, T M \oplus E^{*}, E, M\right)$

Definition 2. A Dirac structure $L_{E} \subset T E \oplus T^{*} E$ is called linear if it defines a double sub vector bundle $(L, F, E, M)$ where $F$ is sub bundle of $T M \oplus E^{*}$.

Example 2. Let $\Pi$ be a linear Poisson bivector on $(E, M, \pi)$. Since $\sharp_{\Pi}: T^{*} E \rightarrow$ $T E$ is a morphism of double vector bundles, it follows that $L_{\Pi}=\operatorname{graph}\left(\sharp_{\Pi}\right) \subset$ $T E \oplus T^{*} E$ is a linear Dirac structure over the sub bundle $F_{\Pi}=\operatorname{graph}\left(\rho_{E^{*}}\right)$ where $\rho_{E^{*}}: E^{*} \rightarrow T M$ is the anchor map of the Lie algebroid $E^{*}$.

Proposition 7. Let $L_{E} \subset T E \oplus T^{*} E$ be a linear Dirac structure over the sub bundle $F \subset T M \oplus E^{*}$. The Dirac structure $L_{T^{r} E} \subset T T^{r} E \oplus T^{*} T^{r} E$ is linear over the sub bundle $\mathcal{T}^{r} F=\left(\kappa_{M}^{r} \oplus I_{E}^{r}\right)\left(T^{r} F\right) \subset T T^{r} M \oplus\left(T^{r} E\right)^{*}$.
Proof. It comes from the fact that, $\kappa_{E}^{r}: T^{r} T E \rightarrow T T^{r} E$ and $\varepsilon_{M}^{r}: T^{r} T^{*} E \rightarrow$ $T^{*} T^{r} E$ are the isomorphism of double vector bundles.

Let $(E,[\cdot, \cdot], \rho)$ be a Lie algebroid over $M$, we consider the cotangent Lie algebroid $r_{E}: T^{*} E \rightarrow E^{*}$ and the Lie algebroid $T E \oplus T^{*} E$ over $T M \oplus E^{*}$.

There is a class of linear Dirac structures $L_{E}$ over $E$, which also define a Lie subalgebroid of $T E \oplus T^{*} E \rightarrow T M \oplus E^{*}$ over some bundle $F \subset T M \oplus E^{*}$. It is called algebroid-Dirac structure.

Proposition 8. Let $L_{E} \subset T E \oplus T^{*} E$ be an algebroid-Dirac structure over the sub bundle $F \subset T M \oplus E^{*}$. The linear Dirac structure $L_{T^{r} E} \subset T T^{r} E \oplus T^{*} T^{r} E$ is an algebroid-Dirac structure over the sub bundle $\mathcal{T}^{r} F=\left(\kappa_{M}^{r} \oplus I_{E}^{r}\right)\left(T^{r} F\right) \subset$ $T T^{r} M \oplus\left(T^{r} E\right)^{*}$.

Proof. Let $u \in \Gamma(E)$, for any $0 \leq \alpha \leq r$ and $\beta \in\{0,1\}$ we have:

$$
\kappa_{E}^{r}\left(\left(u^{(\beta)}\right)^{(\alpha)}\right)=\left(u^{(\alpha)}\right)^{(\beta)} \quad \text { and } \quad\left(\rho^{(r)}\right)^{(1)} \circ \kappa_{E}^{r}=\left(\rho^{(1)}\right)^{(r)}
$$

By the equalities above, we deduce that $\kappa_{E}^{r}: T^{r} T E \rightarrow T T^{r} E$ is an isomorphism of Lie algebroids over $\kappa_{M}^{r}: T^{r} T M \rightarrow T T^{r} M$. As $\varepsilon_{E}^{r}$ is an isomorphism of Lie algebroids over $I_{E}^{r}: T^{r} E^{*} \rightarrow\left(T^{r} E\right)^{*}$, we deduce that $L_{T^{r} E} \subset T T^{r} E \oplus T^{*} T^{r} E$ is an algebroid-Dirac structure over the sub bundle $\mathcal{T}^{r} F=\left(\kappa_{M}^{r} \oplus I_{E}^{r}\right)\left(T^{r} F\right) \subset$ $T T^{r} M \oplus\left(T^{r} E\right)^{*}$.

Remark 7. We denote by $\langle\cdot, \cdot\rangle_{G}$ the non degenerate symmetric pairing on $T G \oplus T^{*} G .\langle\cdot, \cdot\rangle_{G}$ is a morphism of Lie groupoids, where $\mathbb{R}$ is equipped with the usual abelian group structure. We apply the Lie functor, we obtain a non degenerate pairing

$$
A\left(\langle\cdot, \cdot\rangle_{G}\right): A(T G) \oplus A\left(T^{*} G\right) \times_{A G} A(T G) \oplus A\left(T^{*} G\right) \rightarrow \mathbb{R}
$$

By the same way, we denote by $\langle\cdot, \cdot\rangle_{A G}$ the non degenerate symmetric pairing on $T(A G) \oplus T^{*}(A G)$, by the canonical map,

$$
\left(j_{G}^{1}\right)^{-1} \oplus j_{G}: A(T G) \oplus A\left(T^{*} G\right) \rightarrow T(A G) \oplus T^{*}(A G)
$$

we deduce that:

$$
\begin{equation*}
\langle\cdot, \cdot\rangle_{A G}=A\left(\langle\cdot, \cdot\rangle_{G}\right) \circ\left(\left(j_{G}^{1} \oplus j_{G}^{-1}\right) \oplus\left(j_{G}^{1} \oplus j_{G}^{-1}\right)\right) \tag{3.4}
\end{equation*}
$$

Let $L_{G} \subset T G \oplus T^{*} G$ be an almost multiplicative Dirac structure. We put:

$$
\begin{equation*}
L_{A G}=\left(\left(j_{G}^{1}\right)^{-1} \oplus j_{G}\right)\left(A\left(L_{G}\right)\right) \subset T(A G) \oplus T^{*}(A G) \tag{3.5}
\end{equation*}
$$

Clearly, $L_{A G}$ is a linear almost Dirac structure on $A G$. In [17], it is shown that: $L_{A G}$ is integrable if and only if $L_{G}$ is integrable.

Remark 8. We denote by $\operatorname{Dir}_{\text {mult }}(G)\left(\right.$ resp. $\left.\operatorname{Dir}_{\text {alg }}(E)\right)$ the space of all multiplicative Dirac structures on $G$ (resp. algebroid-Dirac structures on $E$ ). We have the natural map

$$
\begin{aligned}
\operatorname{Dir}_{\text {mult }}(G) & \rightarrow \operatorname{Dir}_{\text {alg }}(A G) \\
L_{G} & \mapsto L_{A G}
\end{aligned}
$$

where $L_{A G}=\left(\left(j_{G}^{1}\right)^{-1} \oplus j_{G}\right)\left(A\left(L_{G}\right)\right)$. We have the functor which send an object $\left(G, L_{G}\right)$ to the algebroid-Dirac object $\left(A G, L_{A G}\right)$, and a multiplicative Dirac morphism $f:\left(G, L_{G}\right) \rightarrow\left(H, L_{H}\right)$ to the algebroid-Dirac structure $A f:\left(A G, L_{A G}\right) \rightarrow\left(A H, L_{A H}\right)$. This functor is denoted by $\mathcal{A}$. Via the canonical natural equivalence, this functor coincides with the Lie functor $A$.

Corollary 4. The natural vector bundle

$$
T\left(j_{G}^{r}\right) \oplus T^{*}\left(\left(j_{G}^{r}\right)^{-1}\right): T T^{r}(A G) \oplus T^{*} T^{r}(A G) \rightarrow T\left(A\left(T^{r} G\right)\right) \oplus T^{*}\left(A\left(T^{r} G\right)\right)
$$

send the linear Dirac structure $L_{T^{r}(A G)}$ in $L_{A\left(T^{r} G\right)}$ and it is an isomorphism of Dirac structures.

Proof. We know that,

$$
\begin{aligned}
T\left(j_{G}^{r}\right) \circ \kappa_{A G}^{r} \circ T^{r}\left(\left(j_{G}^{1}\right)^{-1}\right) & =\left(j_{T^{r} G}^{1}\right)^{-1} \circ A\left(\kappa_{G}^{r}\right) \circ j_{T G}^{r} \\
T^{*}\left(\left(j_{G}^{r}\right)^{-1}\right) \circ \varepsilon_{A G}^{r} \circ T^{r}\left(j_{G}\right) & =j_{T^{r} G} \circ A\left(\varepsilon_{G}^{r}\right) \circ j_{T^{*} G}^{r}
\end{aligned}
$$

In this case, we have:

$$
\begin{aligned}
& {\left[T\left(j_{G}^{r}\right) \oplus T^{*}\left(\left(j_{G}^{r}\right)^{-1}\right)\right]\left(\left(\kappa_{A G}^{r} \oplus \varepsilon_{A G}^{r}\right)\left(T^{r}\left(L_{A G}\right)\right)\right)} \\
& \quad=\left[\left(T\left(j_{G}^{r}\right) \circ \kappa_{A G}^{r}\right) \oplus\left(T^{*}\left(\left(j_{G}^{r}\right)^{-1}\right) \circ \varepsilon_{A G}^{r}\right)\right]\left(T^{r}\left(L_{A G}\right)\right) \\
& \quad=\left[\left(T\left(j_{G}^{r}\right) \circ \kappa_{A G}^{r} \circ T^{r}\left(\left(j_{G}^{1}\right)^{-1}\right)\right) \oplus\left(T^{*}\left(\left(j_{G}^{r}\right)^{-1}\right) \circ \varepsilon_{A G}^{r} \circ T^{r}\left(j_{G}\right)\right)\right]\left(T^{r}\left(A\left(L_{G}\right)\right)\right) \\
& \quad=\left[\left(\left(j_{T^{r} G}^{1}\right)^{-1} \circ A\left(\kappa_{G}^{r}\right) \circ j_{T G}^{r}\right) \oplus\left(j_{T^{r} G} \circ A\left(\varepsilon_{G}^{r}\right) \circ j_{T^{*} G}^{r}\right)\right]\left(T^{r}\left(A\left(L_{G}\right)\right)\right) \\
& \quad=\left[\left(\left(j_{T^{r} G}^{1}\right)^{-1} \circ A\left(\kappa_{G}^{r}\right)\right) \oplus j_{T^{r} G} \circ A\left(\varepsilon_{G}^{r}\right)\right]\left(A\left(T^{r} L_{G}\right)\right) \\
& \quad=\left(\left(j_{T^{r} G}^{1}\right)^{-1} \oplus j_{T^{r} G}\right)\left(A\left(\left(\kappa_{G}^{r} \oplus \varepsilon_{G}^{r}\right)\left(T^{r} L_{G}\right)\right)\right) \\
& \quad=\left(\left(j_{T^{r} G}^{1}\right)^{-1} \oplus j_{T^{r} G}\right)\left(A\left(L_{T^{r} G}\right)\right)
\end{aligned}
$$

We conclude that, $\left(T\left(j_{G}^{r}\right) \oplus T^{*}\left(\left(j_{G}^{r}\right)^{-1}\right)\right)\left(L_{T^{r}(A G)}\right)=L_{A\left(T^{r} G\right)}$.
These results generalize the tangent lifts of higher order of multiplicative Poisson structures and multiplicative symplectic structures on the Lie groupoids.

Remark 9. By the Corollary 4 we have the natural equivalence between the functors $\mathcal{A} \circ \mathcal{T}^{r}$ and $\mathcal{T}^{r} \circ \mathcal{A}$.
