ON FIMITE AND COUNTABLE RIGID GRAPHS AND TOURNAMENSS
V. CHVÁTAL, Praha

Let $V$ be a non-void set and $E$ a binary relation on $V$, ECVXV. Let $f$ be a transformation of $V$. If (x,y)e. $F$ implies $(f(x) ; f(y)) \in E$, then $f$ is called compatible with the relation E.

Let $C(\Sigma)$ denote the set of all transformations compatible with a relation $E$. Then $C(E)$ with the binary operation

O ( $O$ is defined, as usual, by the compositions of transformations) is a semigroup, and its unity element is the identity transformation.

The pair [ $\left.V, \mathrm{~F}_{\mathrm{i}}\right]$ will be considered as a graph, where $V$ is the set of vertices, $E$ the set of edges. The transformationsin $C(E)$ will be called endomorphisms of $[V, E]$. If, for every $x, y \in \nabla$, precisely one of the cases $(x, y) \in E$, $(y, x) \in E$ holds, then the graph $[V, E]$ is called a tournament. We emphasize that a tournament contains all loops; thus every constant transformation is an endomorphism.

An $f \in C(E)$ is called an automorphism of the graph [ $V, E]$ if $f$ is $1-1$ mapping; an $f \in C(E)$ is calledyspoper endomorphism of the graph [V,r] if $f$ is not l-1.

Let $C(E)$ contain $|V|+1$ elements (here $|V|$ denotes the cardinal of $V$ ), namely the identity and all the constant transformations of $V$. Then the graph [V,E] is called_rigide_x)
$x$ ) We remark that the expression "rigid graph" is often used in a different sense.

The purpose of this paper is to prove some theorems concerning rigid graphs, and to show how rigid tournaments can be constructed for $|\nabla|>5$.

Theorem 1. There exists no rigid graph for $|\mathbf{V}|=3$ nor for $|V|=4$; there exists just one rigid graph for $|v|=2$.
Theorem 2. There exiet two ${ }^{x}$ ) rigid tournaments for $|V|=5$.
Theorem 3. There exist at least three rigid tournaments for $|\nabla| \geqq 6$ 。

Theorem 4. There exiats a countable rigid tournament.
First, we shall prove some lemmas.
Lemma 1. Let $[V, E]$ be a rigid graph, $|V|>1$; then $(x, x) \in E$ for all $x \in V$.
Proof. If $E=0$, then $C(E)$ contains all transformations of $V$ and $[V, E]$ is not a rigid graph. Hence $E$ contains some couple $(u, \nabla)$, and all the constants are endomorphisms;
thus $(x, x) \in E$ for all $x \in \nabla$.
In the sequel we shall confine ourselves to graphs with all the loops.

Lemma 2. Let $[V, E]$ bo a rigid graph, $x, y \in V, x \neq y$, $(x, y) \in E$. Then $(y, x) \notin E$.

Proof. Let $(x, y) \in E$ and $(y, x) \in E$. Define a transformation $f$ by $f(x)=y, f(u)=x$ for all $u \neq x$. Then fec(E), and we obtain a contradiction.

Lemma 3. Let $|\nabla| \geq 3,[V, E]$ be a rigid graph.
If we define $G(x)=\{u:(x, u) \in E, u \neq x\}$

$$
G^{-1}(x)=\{u:(u, x) \in E, \quad u \neq x\}
$$

then $|G(x)| \geqq 1,\left|G^{-1}(x)\right| \geqslant 1$ for all $x \in V$.
x) Two rigid toumaments are explicitly given in the proof;
it may be easily shown that there are no other ones.

Proof. Let $|G(x)|=\left|G^{-1}(x)\right|=0$. Define $f(x)=x$ ) and $f(u)=y, y \neq x$, for all $u \neq x$. Then $f \in C(E)$ and this is a contradiction.

Let $|G(x)|=0,\left|G^{-1}(x)\right|>0$. Define $f(x)=x$ and $f(u)=$ $=y, y \in G(x)$, for all $u \neq x$. Then $f \in C(E)$ and we have a contradiction.

Similarly for $\left|G^{-1}(x)\right|=0,|G(x)|>0$.
Lerria 4. Let $[V, E]$ be a rigid graph. Then the re exists an $x \in V$, for which $|C(x)|=\left|G^{-1}(x)\right|=1$ does not hold.
Proof. Indeed, assume the relation for all $x \in V$. Put $f(x)=C(x)$ for all $x \in V$. Then $f \in C(E)$ and we obtain a contradiction.
lemma 5. Let $[V, E]$ be a tournament, $|V| \geqq 3,(x, z) \in E$, $(z, y) \in E, f \in C(E), f(x)=f(y)$. Then $f(z)=$ $=f(x)=f(y)$.
Proof. $(f(x), f(z)) \in E,(f(z), f(x)) \in E$ and $[V, z]$ is a tournament; hence $f(x)=f(z)$.
Lemma 6. Let $[V, E]$ be a tournament such that $C(E)$ contains a non-identical automorphism. Then there exist at least three different points $x, y, z \in V$, for which $|G(x)|=|G(y)|=|G(z)|$ holds.
Proof. vidently $|G(x)|=|G(f(x))|$ for all $x \in V$, and there exists a $u \in V$ for which $f(u) \neq u$. If $f \circ f(u)=u$, then $(u, f(u)),(f(u), u) \in E$, and this is a contradiction.
One cannot have $f \circ f(u)=f(u)$, because $f$ is a l-1 transformation. Hence $|G(u)|=|G(f(u))|=|G(f \circ f(u))|$.

Now, we shall prove our theorems.
Proof of theorem l. Using lemmas $1,2,3,4$ it is easy to show that no other graphs except $G_{1}, G_{2}, G_{3}, G_{4}$ on fig. 1 are rigid for $V=2,3,4$. We find easily that the graph $G_{1}$

Fig. 1

Fig. 2

- 432 -
is rigid, and the others have the following endomorphisms:
$G_{2}\binom{x y z u}{z y z u}, \quad G_{3}\binom{x y z u}{y y z u}, \quad G_{4}\binom{x y z u}{u y z u}$.
Proof of theorem 2. Both the tournaments $T_{1}, T_{2}$ on fig. 2 are rigid. We shall denote by $p_{n}$ the number of those $x \in V$ for which $|G(x)|=n \quad(n$ a positive integer). For $T_{1}$ and $T_{2}$ we then obtain
$r_{1}: p_{1}=1, p_{2}=3, p_{3}=1$,
$T_{2}: p_{1}=2, p_{2}=1, p_{3}=2$ 。
By lemma 6 , the tournament $T_{2}$ has no non-identical automorphism.

Let the tournament $T_{1}$ have an automorphism $f$. It follows that $f(x)=x, f(y)=y$. But $(z, u),(u, v),(z, v) \in E$, and thus $f$ must be the identity.

It remains to investigate the proper endomorphisms.
If $(x, y),(y, z),(z, x) \in \xi$, put $\Delta x y z=\{(x, y),(y, z)$, $(z, x)\}$, and $\Delta x y z \sim \Delta u v w$ if $\Delta x y z \cap \Delta u v w \neq D$. If $\Delta x y z \sim \Delta u v w, f \in C(E)$ and $f(x)=f(y)$, then it follows from lemma 5 that $f(x)=f(y)=f(z)=f(u)=f(v)=f(w)$.

Now, it is easy to show that every proper endomorphism of $T_{1}, T_{2}$ is constant.

For $T_{1}$ there is $\Delta x z y \sim \Delta x u y, \quad \Delta x u y \sim \Delta$ vuy,
$\Delta$ vuy $\sim \Delta$ vuz ; and it follows from lemma 5 that $f(x)=$ $=f(\nabla) \Rightarrow f(x)=f(z)$, if $f \in C(E)$.

For $T_{2}$ there is $\Delta x z y \sim \Delta y u z, \Delta$ yuz $\sim \Delta$ vuz ; and it follows from lemma 5 that $f(x)=f(v) \Longrightarrow f(x)=f(z)$, $f(v)=f(y) \Rightarrow f(x)=f(y), f(x)=f(u) \Longrightarrow f(v)=f(u)$, if $f \in C(E)$.

Hence $T_{1}$ and $T_{2}$ have no proper endomorphism except
the constants.
Iroof of theorem 3. We shall construct the rigid tournaments for $|V| \geqq 6$.

Let $\left[V_{0}, E_{0}\right]$ be a rigid tournament, $\left|V_{0}\right|=n, n \geqslant 5$, $p_{n-2} \in\langle 1,2\rangle$. Denote by $x_{0}, y_{0}$ the points for which $\left|G\left(x_{0}\right)\right|=n-2, \quad\left(y_{0}, x_{0}\right) \in E$, and if $p_{n-2}=2$ then $\left|G\left(y_{0}\right)\right| x n-2$. Now set $V=V U\{x\}, E=E_{0} U E_{x}$, $E_{x}=\left\{(x, u): u \in V_{0}, u \neq x_{0}\right\} \cup\left\{\left(x_{0}, x\right),(x, x)\right\}$. Then the tournament $[V, E]$ is rigid.

Indeed, assume that [V,E] has a non-identical automorphism $f$. If $f(x)=x$, then $\left[V_{0}, E_{0}\right]$ has the non-identical automorphism $f_{0}$, defined by $f_{0}(u)=f(u)$ for all $u \in V_{0}$; but this is a contradiction.

If $f(x) \neq x$, then there must be $f\left(x_{0}\right)=x, f(x)=x_{0}$, because $|G(x)|=\left|G\left(x_{0}\right)\right|=n-1$ and $u \neq x, u \neq x_{0} \Rightarrow$ $\Rightarrow|G(u)|<n-1$.

Hence $\left(x, x_{0}\right) \in E$, and this is a contradiction.
Now assume that $[V, E]$ has a proper non-constant endomorphism $f$, and write $f^{-1}(u)=\{v: f(v)=u\}$. If $f^{-1}(u) \cap$ $\cap \nabla_{0} \neq \varnothing$, we may choose an element of $f^{-1}(u) \cap \nabla_{0}$ and denote it $g(u)$. Then $g \circ f$ is a transformation of $V_{0}$.

Let $(u, v) \in E_{0}$. If $g \circ f(u)=g \circ f(v)$, then evidently $(g \circ f(u), g \circ f(v)) \in E_{0}$. If $g \circ f(u) \neq g \circ f(v)$, then $(f(u), f(v)) \in E$ implies ( $g \circ f(u), g \circ f(v)) \in E_{0}$. Hence gofec(E) -

Assume that $g \circ f$ is the identity. Then $u, v \in \boldsymbol{V}_{0}$, $u \neq v$ imply $f(u) \neq f(v)$. One must have $f(x)=f(u)$ for some $u \in V_{0}$, because $f$ is not $1-1$. But there exists a
$\nabla \in V_{0}$ for which $(v, u) \in E, \quad \nabla \neq x_{0}$ and $(f(u), f(v))$, $(f(v), f(u)) \in E$; this is a contradiction.

Assume that $g \circ f$ is a constant. Then $f(u)=\nabla$ for all $u \in V_{0}$ and $(f(x), v),(v, f(x)) \in E$. It follows that $f(x)=f(v)$, so that $f$ is a constant transformation; but this contradicts our assumption.

It results that $\left[V_{0}, E_{0}\right]$ is not rigid, and this is a contradiction. Thus we have proved that [V,E] is rigid.

Setting $|V|=n$, one has $p_{n-2}=2$. It follows that one can construct two sequences of rigid tournaments. Then

$$
p_{1}=2, p_{2}=p_{3}=\cdots p_{n-3}=1, p_{n-2}=2
$$

for the sequence derived from $T_{2}$, and
$p_{1}=1, p_{2}=3, p_{3}=0, p_{4}=p_{5}=\ldots p_{n-3}=1$,
$p_{n-2}=2$
for the sequence derived from $T_{1}$ -
If we take complements of graphs from the second sequence preserving loops, we obtain a sequence of rigid tournaments distinct from both;for this sequence there is
$p_{1}=2, p_{2}=p_{3} \cdots p_{n-5}=1, p_{n-4}=0, p_{n-3}=3$,
$p_{n-2}=1$.
Proof of theorem 4.
In this part we shall denote vertices by positive integers.
If we construct the second sequence of rigid tournaments and proceed to infinity, we obtain a countable tournament [ $N, E]$, where $N$ is the set of all positive integers and $E=B U S$,
$B=\{(1,2),(3,1),(4,1),(5,1),(2,3),(2,4),(5,2),(3,4),(5,3)$,

$$
(4,5),(1,1),(2,2),(3,3),(4,4),(5,5)\}
$$

$S=\{(x, y): x, y \in N, x>5, y<x-1$ VEL $y=x+1$ VEL $y=$
$=x\} \cup\{(5,6)\}$
There is $\quad \Delta 123 \sim \Delta 124 \sim \Delta 245 \sim \Delta 345 \sim \Delta 456 \sim \Delta 567 \ldots$ $\ldots \sim \Delta n n+1 n+2 \sim \Delta n n+1 n+2 n+$ +3~...
and for no other set $\Delta$ except these. Moreover, using lemma 5, there is for $P \in C(E)$
$f(1)=f(5) \Rightarrow f(1)=f(3)$,
$f(u)=f(v) \Rightarrow f(u)=f(u+1)$ if $u>5, u>v+1$,
It follows that if $f$ is an endomorphism of $[\mathrm{N}, \mathrm{E}]$ and there exist $x, y \in N, x \neq y, f(x)=f(y)$, then $f$ is a constant.

Let us assume that [ $N, E$ ] has a non-constant endomorph1sm $P$; then $x \neq y \Rightarrow f(x) \neq f(y)$.

The edge $(4,5)$ is an element of three distinct sets $\Delta 245, \Delta 345$, $\Delta 456$, and no other edge is an element of three or more sets $\Delta$. It follows that $f(4)=4, f(5)=$ $=5$, because the edge $(f(4), f(5))$ is an element of three sets $\Delta$. The edge $(f(5), f(6))$ is an element of two sets $\Delta$, hence $f(6)=6$. Similarly, $f(u)=u$ for all $u>6$.

If $f(u) \neq u$ for some $u \in\{1,2,3\}$, then $T_{1}$ has the automorphism $f_{0}$, defined by $f_{0}(u)=f(u)$, which is not the identity transformation; this is a contradiction.

Thus $f$ is the identity, and we have proved that [ $N, E$ ] is rigid.
Remark to theorem 4. If we derive a countable tournament from $T_{2}$, we obtain the tournament [ $\left.N, E^{\prime}\right]$, where

$$
E^{\prime}=\{(x, y):(x, y) \in E \quad E T(x, y) \neq(2,4)\} \cup\{(4,2)\} ;
$$

however this tournament is not rigid since it has the endom morphism $f$, defined by $f(n)=n+h$, where $h$ is an arm bitrary positive integer.

Applications of the results.

1. Algebra. A set $M$ with a binary operation 0 , which assigns to any ordered pair of elements $M$ some element of $M$, is called a grupoid. If $u \circ v=\nabla \circ u$ for all $u, v \in M$, then $M$ is called a commutative grupoid. The elements $u \in M$ with $u \circ u=u$ are called idempotents. If $f$ is a transformation of $M$ and for every $u, v \in M$ there is $f(u) \circ f(v)=$ $=f(u \circ \nabla)$, then $f$ is called a homomorphism of the grupoid.

Let $[V, E]$ be a rigid tournament. We may define a binar ry operation $O$ on $V$ by $u \circ \nabla=u$ for ( $v, u) \in E$ $u O V=\nabla$ for (u,v) EE.

Evidently, the set $V$ with the binary operation 0 is a commatative grupoid such that all elements are idempotents and that each homomorphism is either constant or the identity transformation. Thus

There exists a commutative grupoid $G$ such that all elements are idempotents and that each homomorphism is either constant or the identity transformation for $5 \leq 1 G \mid \leq N_{0}$ 2. Rigid closure spaces. If $P$ is a set with a rule which assigns to any set $M \subset P$ its closure $\bar{M}$ in such a manner that the axioms

$$
\begin{align*}
& \varnothing=\bar{\emptyset}  \tag{I}\\
& \mathrm{m} \subset \overline{\mathrm{M}}
\end{align*}
$$

$$
\overline{M_{1} \cup M_{2}}=\bar{M}_{1} \cup \bar{M}_{2} \quad \text { (III) } \quad \text { (see [l]) }
$$

are fulfilled, then $P$ is called a closure space. A transfor-
formation $P$ of $P$ is called continuous if $f(\bar{M}) \subset \overline{P(M)}$, where $f(M)=\{x: x=f(u), u \in M\}$.

Let [V,E] be a rigid tournament, and set
$\overline{\mathbf{Y}}=\{\mathrm{x}:(\mathrm{u}, \mathrm{x}) \in \mathrm{E}, \mathrm{u} \in \boldsymbol{Y}\}$ for any set $\mathbf{Y} \subset \mathrm{P}$. The set $V$ with the so defined closure is a closure space, all continuous transformations of which are either constant or identical. Thus:

There exists a closure space $P$ such that all continuous transformations of $P$ are either constant or the identity transformations providod that $5 \leq|P| \leq H_{0} \cdot$

I thank $Z$. Hedrlin for much valuable advice.
