# A note on Schroeder-Bernstein Property and Primary Property of Orlicz function spaces 

Yanzheng Duan, Shutao Chen

#### Abstract

It is shown in the note that every reflexive Orlicz function space has the Schroeder-Bernstein Property and the Primary Property.

Keywords: Orlicz function spaces, Schroeder-Bernstein Property, Primary Property Classification: 46B20

Let $G=[0,1]$ and $\mu$ be the Lebesgue measure on $G$. We denote by $M$ : $(-\infty,+\infty) \rightarrow[0,+\infty)$ a continuous, convex and even function satisfying $M(u)=$ 0 iff $u=0$ and $M(u) / u \rightarrow 0(+\infty)$ as $u \rightarrow 0(+\infty)$; by $N(v)$ the complementary function of $M(u)$, i.e., $N(v):=\max _{u}\{u v-M(u)\}$. We say $M \in \Delta_{2}$ if for any $u_{0}>0$ there exists $K>2$ such that $M(2 u) \leq K M(u), u \geq u_{0}$. For every $\mu$ measurable function $f: G \rightarrow(-\infty,+\infty)$, let $\varrho_{M}(f)=\int_{G} M(f(t)) d \mu$; then the Orlicz space

$$
L_{M}=\left\{f: \varrho_{M}(a f)<+\infty \text { for some } a>0\right\}
$$

endowed with the Luxemburg norm

$$
\|f\|=\inf \left\{r: \varrho_{M}(f / r) \leq 1\right\}
$$

or Orlicz norm

$$
\|f\|_{M}=\min _{k>0}\left[1+\varrho_{M}(k f)\right] / k
$$

is a Banach space and $\|f\|_{M} \leq\|f\| \leq 2\|f\|_{M}$ for every $f \in L_{M}$. More details about Orlicz spaces can be found in [2] and [4].

Let $Y$ be a closed subspace of a Banach space $X . Y$ is called a complemented subspace of $X$ if there exists a linear, continuous and surjective projection from $X$ to $Y$. A Banach space $X$ is said to have the Schroeder-Bernstein Property (SBP) if for any Banach space $Y, X$ is isomorphic to $Y$ whenever $X$ is isomorphic to a complemented subspace of $X$. A Banach space $X$ is said to have the Primary Property if, for every linear, bounded projection $P$ of $X, X$ is isomorphic to $P X$ or $(I-P) X$. Many spaces, for example, $L^{p}(1<p<+\infty)$ and James space $J$, have $S B P$ and Primary Property (see [1]).

Without loss of generality, let $M(1)=1$. Then $\left(L_{M},\|\cdot\|\right)$ is an r.i. (i.e. rearrangement invariant) function space. More details about this space can be found in [3]. By Proposition 2.b.5 in [3], the Boyd indices for $L_{M}$ are

$$
p_{L_{M}}=\sup \left\{p: \inf _{\lambda, t \geq 1} \frac{M(t \lambda)}{M(\lambda) t^{p}}>0\right\}
$$

and

$$
q_{L_{M}}=\inf \left\{q: \sup _{\lambda, t \geq 1} \frac{M(t \lambda)}{M(\lambda) t^{p}}<+\infty\right\}
$$

In general, $1 \leq p_{L_{M}} \leq q_{L_{M}} \leq+\infty$.
Theorem 1. For the Orlicz space $\left(L_{M},\|\cdot\|\right)$, we have
(1) $q_{L_{M}}<+\infty$ if and only if $M \in \Delta_{2}$;
(2) $p_{L_{M}}>1$ if and only if $N \in \Delta_{2}$.

Proof: (1) Necessity. If $q_{L_{M}}<+\infty$, then there exist constants $K>1$ and $q_{0} \geq 1$ such that $M(t \lambda) /\left(M(\lambda) t^{q_{0}}\right) \leq K$ for all $\lambda, t \geq 1$. Let $t=2$, then $M(2 \lambda) \leq 2^{q_{0}} K M(\lambda)$ for all $\lambda \geq$ 1, i.e., $M \in \Delta_{2}$.

Sufficiency. Since $M \in \Delta_{2}$, by [4], there exists a constant $K>2$ such that $M(2 t) \leq K M(t)$ for all $t \geq 1$. Choose an integer $n \geq 0$ such that $2^{n} \leq t<2^{n+1}$; then for all $\lambda \geq 1$ and $q>1$ satisfying $K / 2^{q} \leq 1$, we have

$$
\frac{M(t \lambda)}{M(\lambda) t^{q}} \leq \frac{M\left(2^{n+1} \lambda\right)}{2^{n q} M(\lambda)} \leq \frac{K^{n+1} M(\lambda)}{2^{n q} M(\lambda)}=K\left(\frac{K}{2^{q}}\right)^{n} \leq K
$$

Thus, by the definition of $q_{L_{M}}$, we have $q_{L_{M}}<+\infty$.
(2) Necessity. If $p_{L_{M}}>1$, then there exist $\varepsilon>0$ and $\delta>0$ such that $M(t \lambda) /\left(M(\lambda) t^{1+2 \varepsilon}\right) \geq \delta$ for all $\lambda, t \geq 1$. Choose $t_{0}$ satisfying $t_{0}^{\varepsilon} \delta \geq 1$, then for all $\lambda \geq 1$, we have

$$
\frac{M\left(t_{0} \lambda\right)}{M(\lambda) t_{0}^{1+\varepsilon}} \geq t_{0}^{\varepsilon} \delta \geq 1
$$

Therefore, $M\left(t_{0} \lambda\right) \geq t_{0}^{1+\varepsilon} M(\lambda)$ for all $\lambda \geq 1$. So $N \in \Delta_{2}$ by [4].
Sufficiency. If $N \in \Delta_{2}$, then, by [4], there exists $\varepsilon>0$ such that $M(2 \lambda) \geq$ $2^{1+\varepsilon} M(\lambda)$ for all $\lambda \geq 1$. Choose a positive integer $k_{0}$ such that $p=(1+\varepsilon) k_{0} /(1+$ $\left.k_{0}\right)>1$. For all $\lambda \geq 1$ and $t \geq 2^{k_{0}}$ choose integer $k$ such that $2^{k_{0}} \leq 2^{k} \leq t<2^{k+1}$, then

$$
\frac{M(t \lambda)}{M(\lambda) t^{p}} \geq \frac{M\left(2^{k} \lambda\right)}{M(\lambda) 2^{(k+1) p}} \geq \frac{2^{(1+\varepsilon) k} M(\lambda)}{2^{(k+1) p} M(\lambda)}=2^{(1+\varepsilon) k-(k+1) p} \geq 2^{0}=1
$$

Note the last inequality of the above formula is assured by the monotone increasing of the function $f(x)=(1+\varepsilon) x /(1+x) \quad(x>0)$.

On the other hand, for all $\lambda \geq 1$ and $t \in\left[1,2^{k_{0}}\right)$, we have

$$
\frac{M(t \lambda)}{M(\lambda) t^{p}} \geq \frac{M(\lambda)}{2^{k_{0} p} M(\lambda)}=\frac{1}{2^{k_{0} p}}
$$

Therefore, for all $\lambda, t \geq 1$, we have

$$
\frac{M(t \lambda)}{M(\lambda) t^{p}} \geq \min \left\{1, \frac{1}{2^{k_{0} p}}\right\}>0
$$

Thus, $p_{L_{M}} \geq p>1$.
By [4] and Theorem 1, we immediately get the following corollary.
Corollary 2. $L_{M}$ is reflexive if and only if $p_{L_{M}}>1$ and $q_{L_{M}}<+\infty$.
Theorem 3. If $L_{M}$ is reflexive, then $L_{M}$ has SBP.
Proof: If $L_{M}$ is reflexive, then by Theorem $1, p_{L_{M}}>1$ and $q_{L_{M}}<+\infty$. Therefore, if a Banach space $X$ is isomorphic to a complemented subspace of $L_{M}$ and $L_{M}$ is also isomorphic to a complemented subspace of $X$, then Proposition 2.d. 5 in [3] implies that $L_{M}$ is isomorphic to $X$. So $L_{M}$ has SBP.
Theorem 4. If $L_{M}$ is reflexive, then $L_{M}$ has the Primary Property.
Proof: If $L_{M}$ is reflexive, then by [4] and Theorem $1, L_{M}$ is separable, $p_{L_{M}}>1$ and $q_{L_{M}}<+\infty$. Since $L_{M}$ is an r.i. function space, Theorem 2.d.11 in [3] implies that $L_{M}$ has the Primary Property.
