## CHARACTERIZATION OF $\alpha$ -ENTROPY WITH PREFERENCE

R.K.TUTEJA, L. C. SINGHAL, ASHOK KUMAR

A characterization of  $\alpha$ -entropy with preference is provided. Further an attempt is made to characterize this measure by weakening the symmetry postulate.

### 1. INTRODUCTION

Let  $A_n = (p_1, p_2, \dots, p_n)$ ,  $p_i \geq 0$ ,  $\sum_{i=1}^n p_i = 1$  be a probability distribution associated with discrete random variable  $X$  assuming a finite number of values  $X_1, X_2, \dots, X_n$ . Havrda and Charvát entropy of order  $\alpha$  (cf. [2]) is defined as

$$(1.1) \quad I_n(A_n) = \frac{\sum_{i=1}^n p_i^\alpha - 1}{2^{1-\alpha} - 1}, \quad \alpha \neq 1, \quad \alpha > 0.$$

In order to distinguish the events  $X_1, X_2, \dots, X_n$  of a goal directed experiment according to their importance with respect to the goal, Belis and Guiașu [1] introduced a ‘utility distribution’  $(u_1, u_2, \dots, u_n)$ , where each  $u_i > 0$  is the utility of an event with probability  $p_i$ . Then  $\alpha$ -entropy with preference is given by

$$(1.2) \quad I_n(P, U) = \frac{\sum_{i=1}^n u_i p_i (p_i^{\alpha-1} - 1)}{2^{1-\alpha} - 1}, \quad \alpha \neq 1, \quad \alpha > 0.$$

In this paper, we characterize this measure by axiomatic approach. Also the postulate of symmetry is replaced by a weaker postulate.

## 2. CHARACTERIZATION

Let

$$I_n: \Delta_n \times \mathbb{R}_+^n \rightarrow \mathbb{R}, \quad n \geq 2$$

where

$$\Delta_n = (p_1, p_2, \dots, p_n), \quad 0 \leq p_i \leq 1, \quad \sum_{i=1}^n p_i = 1, \quad \mathbb{R}_+ = (0, \infty),$$

satisfies the following postulates.

**Postulate P 1** (Recursivity).

$$\begin{aligned} I_n(p_1, p_2, \dots, p_n; u_1, u_2, \dots, u_n) &= \\ I_{n-1}(p_1 + p_2, \dots, p_n; u_{1,2}, u_3, \dots, u_n) &+ \\ + (p_1 + p_2)^\alpha I_2\left(\frac{p_1}{p_1 + p_2}, \frac{p_2}{p_1 + p_2}; u_1, u_2\right) & \end{aligned}$$

where  $u_{1,2} = (u_1 p_1 + u_2 p_2)/(p_1 + p_2)$ ,  $p_1 + p_2 \in (0, 1]$ .

**Postulate P 2** (Symmetry).  $I_n(p_1, p_2, \dots, p_n; u_1, u_2, \dots, u_n)$  is a pairwise symmetric function of its arguments.

**Postulate P 3** (Differentiability).  $f(p, u_1, u_2) = I_2(p, 1 - p; u_1, u_2)$  has continuous first order partial derivatives with respect to all the three variables.

**Postulate P 4** (Normalization).  $I_2(\frac{1}{2}, \frac{1}{2}; \lambda, \lambda) = \lambda$ ,  $I_2(1, 0, u_1, u_2) = 0$ ;  $\lambda > 0$ .

**Theorem 2.1.** If  $I_n: \Delta_n \times \mathbb{R}_+^n \rightarrow \mathbb{R}$ , ( $n = 2, 3, \dots$ ) satisfy Postulates P 1, P 2, P 3 and P 4, then

$$(2.1) \quad I_n(p_1, p_2, \dots, p_n; u_1, u_2, \dots, u_n) = \frac{\sum_{i=1}^n p_i u_i (p_i^{\alpha-1} - 1)}{2^{1-\alpha} - 1} \quad \alpha \neq 1, \quad \alpha > 0.$$

**Proof.** By symmetric Postulate P 2, we have

$$\begin{aligned} (2.2) \quad I_3(p_1, p_2, p_3; u_1, u_2, u_3) &= I_3(p_2, p_3, p_1; u_2, u_3, u_1) = \\ &= I_3(p_3, p_1, p_2; u_3, u_1, u_2). \end{aligned}$$

Using Postulate P 1 in (2.2), we get the following functional equation

$$\begin{aligned} (2.3) \quad f(p_1 + p_2; u_{1,2}, u_3) + (p_1 + p_2)^\alpha f\left(\frac{p_1}{p_1 + p_2}; u_1, u_2\right) &= \\ &= f(p_1, u_1, u_{2,3}) + (1 - p_1)^\alpha f\left(\frac{p_2}{1 - p_1}; u_2, u_3\right), \\ p_1 + p_2 \in (0, 1], \quad p_1 \in [0, 1) & \end{aligned}$$

and

$$(2.4) \quad f(p_1 + p_2; u_{1,2}, u_3) + (p_1 + p_2)^\alpha f\left(\frac{p_1}{p_1 + p_2}; u_1, u_2\right) = \\ = f(p_2, u_2, u_{1,3}) + (1 - p_2)^\alpha f\left(\frac{p_1}{1 - p_2}, u_1, u_3\right), \quad p_1 + p_2 \in (0, 1], \quad p_2 \in [0, 1].$$

Differentiating partially (2.3) and (2.4) with respect to  $p_2$ , and  $p_1$  respectively,

$$(2.5) \quad f_p(p_1 + p_2, u_{1,2}, u_3) + \frac{p_1(u_2 - u_1)}{(p_1 + p_2)^2} f_{u_{1,2}}(p_1 + p_2, u_{1,2}, u_3) + \\ + \alpha(p_1 + p_2)^{\alpha-1} f\left(\frac{p_1}{p_1 + p_2}, u_1, u_2\right) - p_1(p_1 + p_2)^{\alpha-2} f_p\left(\frac{p_1}{p_1 + p_2}, u_1, u_2\right) = \\ = (1 - p_1)^{\alpha-1} f_p\left(\frac{p_2}{1 - p_1}, u_2, u_3\right)$$

$$(2.6) \quad f_p(p_1 + p_2, u_{1,2}, u_3) - \frac{p_2(u_2, u_1)}{(p_1 + p_2)^2} f_{u_{1,2}}(p_1 + p_2, u_{1,2}, u_3) + \\ + \alpha(p_1 + p_2)^{\alpha-1} f\left(\frac{p_1}{p_1 + p_2}, u_1, u_2\right) + p_2(p_1 + p_2)^{\alpha-2} f_p\left(\frac{p_1}{p_1 + p_2}, u_1, u_2\right) = \\ = (1 - p_2)^{\alpha-1} f_p\left(\frac{p_1}{1 - p_2}, u_1, u_3\right)$$

Setting  $p_1 + p_2 = 1$ , the equations (2.5) and (2.6) give

$$(2.7) \quad f_p(p, u_1, u_2) = p^{\alpha-1} f_p(1, u_1, u_3) - (1 - p_1)^{\alpha-1} f_p(1, u_2, u_3) + \\ + (u_2 - u_1) f_{u_{1,2}}(1, u_{1,2}, u_3).$$

Setting  $f_u(1, u, u') = B$ ,  $f_p(1, u, u') = A zu$  in (2.7) and integrating with respect to  $p$ ,

$$(2.8) \quad f(p, u_1, u_2) = A[u_1 p^\alpha + u_2 (1 - p)^\alpha] - B[u_1 p + u_2 (1 - p)] + C(u_1, u_2).$$

Normalization Postulate P 4 gives

$$A = B = 1/(2^{1-\alpha} - 1), \quad C = 0.$$

Therefore

$$(2.9) \quad f(p, u_1, u_2) = \frac{u_1 p(p^{\alpha-1} - 1) + u_2 (1 - p)((1 - p)^{\alpha-1} - 1)}{2^{1-\alpha} - 1}$$

By successive application of P 1 we get

$$(2.10) \quad I_n(p_1, p_2, \dots, p_n; u_1, u_2, \dots, u_n) = \\ = \sum_{k=2}^n (p_1 + p_2 + \dots + p_k)^\alpha I_2\left(\frac{p_1 + p_2 + \dots + p_{k-1}}{p_1 + p_2 + \dots + p_k}, \frac{p_k}{p_1 + \dots + p_k}, u_{1,2,\dots,k-1}, u_k\right) =$$

$$\begin{aligned}
&= \sum_{k=2}^n (p_1 + p_2 + \dots + p_k)^\alpha f\left(\frac{p_1 + p_2 + \dots + p_{k-1}}{p_1 + p_2 + \dots + p_k}, u_{1,2,\dots,k-1}, u_k\right) = \\
&= \sum_{k=2}^n q_k^\alpha f\left(\frac{q_{k-1}}{q_k}, u_{1,2,\dots,k-1}, u_k\right)
\end{aligned}$$

where  $q_k = p_1 + p_2 + \dots + p_k$ ,  $u_{1,2,\dots,k} = (q_{k-1}u_{1,2,\dots,k-1} + p_k u_k)/q_k$ .

(2.9) and (2.10) gives

$$\begin{aligned}
I_n(p_1, p_2, \dots, p_n; u_1, u_2, \dots, u_n) &= \\
&= \frac{1}{2^{1-\alpha} - 1} \left[ \sum_{k=2}^n q_k^\alpha \left[ u_{1,2,\dots,k-1} \left( \frac{q_{k-1}}{q_k} \right)^{\alpha-1} - 1 \right] + u_k \frac{p_k}{q_k} \left[ \left( \frac{p_k}{q_k} \right)^{\alpha-1} - 1 \right] \right] = \\
&= \frac{1}{2^{1-\alpha} - 1} \sum_{k=2}^n [u_{1,2,\dots,k-1} q_k^{\alpha-1} + u_k p_k^{\alpha-1} - q_k^{\alpha-1} [u_{1,2,\dots,k-1} q_{k-1} + u_k p_k]] = \\
&= \frac{\sum_{i=2}^n u_i p_i (p_i^{\alpha-1} - 1)}{2^{1-\alpha} - 1}
\end{aligned}$$

This completes the proof of the theorem.

### 3. CHARACTERIZATION WITHOUT SYMMETRY

In this section, we characterize  $\alpha$ -entropy with preference without assuming symmetry. We replace the postulate of symmetry with a weaker postulate.

**Definition 3.1.** Let  $n$  be a positive integer greater than 1 and  $A, B$  be two non-empty subset of  $\mathbb{R}$ . A function  $f_n: A^n \times B^n \rightarrow \mathbb{R}$  is said to be  $n$ -cyclic over its domain if it is invariant under one cyclic shift, that is

$$\begin{aligned}
f_n(x_1, x_2, \dots, x_{n-1}, x_n; y_1, y_2, \dots, y_n) &= \\
&= f_n(x_n, x_1, x_2, \dots, x_{n-1}; y_n, y_1, \dots, y_{n-1}), \quad n \geq 2 \\
(x_1, x_2, \dots, x_n) &\in A^n, \quad (y_1, y_2, \dots, y_n) \in B^n.
\end{aligned}$$

**Definition 3.2.** A sequence of functions  $\{f_n\}_{n \geq 2}$  where  $f_n: A_n \times \mathbb{R}_+^n \rightarrow \mathbb{R}$ , is called left expandible if

$$\begin{aligned}
f_n(p_1, p_2, \dots, p_n, u_1, u_2, \dots, u_n) &= \\
&= f_{n+1}(0, p_1, p_2, \dots, p_n, u, u_1, \dots, u_n) \quad u > 0
\end{aligned}$$

where  $\mathbb{R}_+ = (0, \infty)$ .

**Postulate P 5 (Cyclic Symmetry).**  $I_n(p_1, p_2, \dots, p_n; u_1, u_2, \dots, u_n)$  is an  $n$ -cyclic symmetric function of its arguments.

For  $n = 2$ , Postulate P 2 and P 5 are equivalent. It is obvious that P 2 implies P 5, but the converse is not true. For example consider the following:

**Example 1.** Let  $\phi_n: A_n \times \mathbb{R}_+^n \rightarrow \mathbb{R}$ ,  $n = 2, 3, 4, \dots$ , be defined as

$$\begin{aligned} & \phi_n(p_1, p_2, \dots, p_n; u_1, u_2, \dots, u_n) = \\ &= \sum_{i=1}^{n-1} (u_i p_i + u_{i+1} p_{i+1}) (p_i - p_{i+1}) + (u_n p_n + u_1 p_1) (p_n - p_1). \end{aligned}$$

Then  $\{\phi_n\}_{n \geq 2}$  is an  $n$ -cyclic sequence of functions, but functions  $\phi_n$  are not symmetric for  $n > 2$ . Hence Postulate P 5 is weaker than P 2.

**Lemma 3.1.** Postulates P 1, P 4 and P 5 ( $n \geq 2$ ) imply left expansibility, i.e.,

$$(3.1) \quad \begin{aligned} & I_n(p_1, p_2, \dots, p_n; u_1, u_2, \dots, u_n) = \\ &= I_{n+1}(0, p_1, p_2, \dots, p_n; u, u_1, u_2, \dots, u_n) \quad \text{for } u > 0. \end{aligned}$$

**Proof.** Let  $p_k$  be the last non-zero component of  $(0, p_1, \dots, p_n)$ . Then the right side of equation (3.1) is

$$(3.2) \quad \begin{aligned} & I_{n+1}(0, p_1, p_2, \dots, p_k, 0, 0, \dots, 0; u, u_1, u_2, \dots, u_k, u_{k+1}, \dots, u_n) = \\ & \stackrel{\text{P5}}{=} I_{n+1}(p_k, 0, 0, \dots, 0, p_1, \dots, p_{k-1}; u_k, u_{k+1}, \dots, u_n, u, u_1, u_2, \dots, u_{k-1}) = \\ & \stackrel{\text{P4}}{=} I_n(p_k, 0, \dots, 0, p_1, \dots, p_{k-1}; u_k, u_{k+2}, u_{k+3}, \dots, u_n, u, u_1, \dots, u_{k-1}) + \\ & \quad + (p_k)^* I_2(1, 0, u_k, u_{k+1}) = \\ & \stackrel{\text{P4}}{=} I_n(p_k, 0, \dots, p_1, \dots, p_{k-1}; u_k, u_{k+2}, \dots, u_n, u, u_1, \dots, u_{k-1}) = \\ & \stackrel{\text{Inductively}}{=} I_k(p_k, p_1, \dots, p_{k-1}, u_k, u_1, u_2, \dots, u_{k-1}). \end{aligned}$$

Similarly, the left hand side of (3.1) can be proved to be equal to (3.2). This completes the proof.

**Lemma 3.2.** Postulates P 1, P 4 and P 5 imply P 2.

**Proof.** For  $n = 2$ , the result is obvious. For  $n = 3$  and one of the  $p_i$  is zero, then the result follows from Lemma 3.1, Postulate P 5 and symmetry of  $I_2$ . If all  $p_i > 0$ ,  $i = 1, 2, 3$ , then Postulate P 1 and symmetry of  $I_2$  give

$$(3.3) \quad I_3(p_1, p_2, p_3; u_1, u_2, u_3) = I_3(p_2, p_1, p_3; u_2, u_1, u_3).$$

Postulate P 5 and equation (3.3) imply symmetry of  $I_3$ .

Now, we prove that  $I_n$ ,  $n \geq 4$  are also symmetric functions of their arguments. We complete the proof by induction on  $n$ . The result follows immediately from Lemma 3.1, Postulate P 5 and induction hypothesis if one of  $p_i$  is zero. Hence it is enough to prove the following for  $p_i > 0$  for each  $i$

$$(3.4) \quad I_n(p_1, p_2, \dots, p_n; u_1, u_2, \dots, u_n) = I_n(p_2, p_1, p_3, \dots, p_n; u_2, u_1, u_3, \dots, u_n)$$

$$(3.5) \quad \begin{aligned} & I_n(p_1, p_2, p_3, \dots, p_n; u_1, u_2, u_3, \dots, u_n) = \\ &= I_n(p_1, p_2, p_{k(3)}, p_{k(4)}, \dots, p_{k(n)}; u_1, u_2, u_{k(3)}, \dots, u_{k(n)}) \end{aligned}$$

$$(3.6) \quad \begin{aligned} & I_n(p_1, p_2, p_3, p_4, \dots, p_n; u_1, u_2, u_3, u_4, \dots, u_n) = \\ &= I_n(p_3, p_2, p_1, p_4, \dots, p_n; u_3, u_2, u_1, u_4, \dots, u_n) \end{aligned}$$

where  $\{k(3), k(4), \dots, k(n)\}$  is an arbitrary permutation of  $\{3, 4, \dots, n\}$ .

First we prove (3.4)

$$\begin{aligned}
I_n(p_1, p_2, p_3, \dots, p_n; u_1, u_2, u_3, \dots, u_n) &= \\
\stackrel{\text{P1}}{=} I_{n-1}(p_1 + p_2, p_3, \dots, p_n; u_{1,2}, u_3, \dots, u_n) + \\
&+ (p_1 + p_2)^\alpha I_2\left(\frac{p_1}{p_1 + p_2}, \frac{p_2}{p_1 + p_2}, u_1, u_2\right) = \\
\stackrel{\text{Symmetry of } I_2}{=} I_{n-1}(p_1 + p_2, p_3, \dots, p_n; u_{1,2}, u_3, \dots, u_n) + \\
&+ (p_1 + p_2)^\alpha I_2\left(\frac{p_2}{p_1 + p_2}, \frac{p_1}{p_1 + p_2}, u_2, u_1\right) = \\
\stackrel{\text{P1}}{=} I_n(p_2, p_1, p_3, \dots, p_n; u_2, u_1, u_3, \dots, u_n).
\end{aligned}$$

Now we prove (3.5)

$$\begin{aligned}
I_n(p_1, p_2, \dots, p_n; u_1, u_2, \dots, u_n) &\stackrel{\text{P1}}{=} I_{n-1}(p_1 + p_2, p_3, \dots, p_n; u_{1,2}, u_3, \dots, u_n) + \\
&+ (p_1 + p_2)^\alpha I_2\left(\frac{p_1}{p_1 + p_2}, \frac{p_2}{p_1 + p_2}, u_1, u_2\right) = \\
\stackrel{\text{by the induction hypothesis}}{=} I_{n-1}(p_1 + p_2, p_{k(3)}, \dots, p_{k(n)}; u_{1,2}, u_{k(3)}, \dots, u_{k(n)}) + \\
&+ (p_1 + p_2)^\alpha I_2\left(\frac{p_1}{p_1 + p_2}, \frac{p_2}{p_1 + p_2}, u_1, u_2\right) = \\
\stackrel{\text{P1}}{=} I_n(p_1, p_2, p_{k(3)}, \dots, p_{k(n)}; u_1, u_2, u_{k(3)}, \dots, u_{k(n)}),
\end{aligned}$$

where  $\{k(3), k(4), \dots, k(n)\}$  is an arbitrary permutation of  $\{3, 4, \dots, n\}$ .

Finally we prove (3.6)

$$\begin{aligned}
I_n(p_1, p_2, p_3, p_4, \dots, p_n; u_1, u_2, u_3, u_4, \dots, u_n) &= \\
\stackrel{\text{P5}}{=} I_n(p_{n-1}, p_n, p_1, p_2, \dots, p_{n-2}; u_{n-1}, u_n, u_1, \dots, u_{n-2}) = \\
\stackrel{\text{Eq. (3.5)}}{=} I_n(p_{n-1}, p_n, p_3, p_2, p_1, p_4, \dots, p_{n-2}; u_{n-1}, u_n, u_3, u_2, u_1, u_4, \dots, u_{n-2}) = \\
\stackrel{\text{P5}}{=} I_n(p_3, p_2, p_1, p_4, \dots, p_n; u_3, u_2, u_1, u_3, \dots, u_n).
\end{aligned}$$

This completes the proof of the lemma.

**Theorem 3.1.** If  $I_n: A_n \times \mathbb{R}_+^n \rightarrow \mathbb{R}$ , ( $n = 2, 3, \dots$ ) satisfy Postulates P 1, P 3, P 4 and P 5, then  
(3.7)

$$I_n(p_1, p_2, \dots, p_n; u_1, u_2, \dots, u_n) = \frac{1}{2^{1-\alpha} - 1} \sum_{i=1}^n u_i p_i (p_i^{\alpha-1} - 1) \quad \alpha > 0, \alpha \neq 1.$$

The proof of the theorem follows from Lemma 3.2 and Theorem 2.1.
