# CONVERGENCE ESTIMATE FOR SECOND ORDER CAUCHY PROBLEMS WITH A SMALL PARAMETER 

Branko Najman, Zagreb

(Received December 19, 1995)

Abstract. We consider the second order initial value problem in a Hilbert space, which is a singular perturbation of a first order initial value problem. The difference of the solution and its singular limit is estimated in terms of the small parameter $\varepsilon$. The coefficients are commuting self-adjoint operators and the estimates hold also for the semilinear problem.

## 1. Introduction

We consider the initial value problem in a Hilbert space $X$

$$
\begin{equation*}
\varepsilon u_{t t}+A u_{t}+B u+f(u)=0, u(0)=u_{0 \varepsilon}, u_{t}(0)=u_{1 \varepsilon} \tag{1}
\end{equation*}
$$

for $\varepsilon>0$, and its limit

$$
\begin{equation*}
A u_{t}+B u+f(u)=0, u(0)=u_{00} . \tag{2}
\end{equation*}
$$

The operators $A$ and $B$ are commuting positive self-adjoint operators in $X$. This problem has been throughly investigated when $A=a I$ (see [2]). If $A$ is not a multiple of identity, two papers have recently appeared treating the commutative case. In [1], the space $X$ is a Banach space, $f=0, B$ is the generator of a strongly continuous cosine family and $A$ is a bounded operator commuting with $B$. In [3], the space $X$ is a Hilbert space and $A$ and $B$ are commuting (in general unbounded) positive self-adjoint operators. There it is shown that under mild conditions on $f$, $u_{0 \varepsilon}$ and $u_{1 \varepsilon}$, the solutions $u_{\varepsilon}$ of (1) converge locally uniformly in $t$ to the solution $u_{0}$ of (2). However, the convergence rate for $u_{\varepsilon}-u_{0}$ has not been established. In [1], this convergence rate was estimated.

It is our aim to estimate $u_{\varepsilon}-u_{0}$ and its derivative $u_{\varepsilon}^{\prime}-u_{0}^{\prime}$ under the assumptions similar to those of [3].

We list our assumptions.
(A1) The operators $A$ and $B$ are commuting uniformly positive self-adjoint operators in $X$ such that $B$ is $A^{2}$-bounded.

This means that $B A^{-2}$ is a bounded operator. The assumption (3) is sufficiently general to allow the applications described in Cases 1 and 2 in [3]. The assumption (3) implies that the damping term $A$ is "large". In the other extreme case when $A$ is bounded, the estimates from [1] apply.

In the first three results we consider the linear case. We always consider mild solutions of (1) and (2) (see [3]); when the initial data are sufficiently regular, these solutions have additional regularity properties.

Theorem 1. Assume (A1) and $f=0$. There exist $C>0$ and $\varepsilon_{0}>0$ such that for all $t \geqslant 0$ and $\varepsilon \in\left(0, \varepsilon_{0}\right)$ the following estimate holds:

$$
\begin{align*}
\left\|u_{\varepsilon}(t)-u_{0}(t)\right\| \leqslant & C\left[\varepsilon\left(\left\|u_{0 \varepsilon}\right\|+t\left\|B A^{-1} \mathrm{e}^{-t B A^{-1}} u_{0 \varepsilon}\right\|+\left\|A^{-1} u_{1 \varepsilon}\right\|\right)\right. \\
& \left.+\left\|\mathrm{e}^{-t B A^{-1}}\left(u_{0 \varepsilon}-u_{00}\right)\right\|\right] \tag{4}
\end{align*}
$$

The next estimates follow from (4).

Proposition 2. Assume (A1) and $f=0$. There exist $C>0$ and $\varepsilon_{0}>0$ such that for all $t \geqslant 0$ and $\varepsilon \in\left(0, \varepsilon_{0}\right)$ the following estimates hold:

$$
\begin{equation*}
\left\|u_{\varepsilon}(t)-u_{0}(t)\right\| \leqslant C\left[\varepsilon\left(\left\|u_{00}\right\|+\left\|A^{-1} u_{1 \varepsilon}\right\|\right)+\left\|u_{0 \varepsilon}-u_{00}\right\|\right], \tag{5}
\end{equation*}
$$

$$
\begin{equation*}
\left\|u_{\varepsilon}^{\prime}(t)-u_{0}^{\prime}(t)\right\| \leqslant C\left[\varepsilon\left\|B A^{-1} u_{00}\right\|+\left\|u_{1 \varepsilon}+B A^{-1} u_{0 \varepsilon}\right\|+\left\|u_{1 \varepsilon}+B A^{-1} u_{00}\right\|\right] . \tag{6}
\end{equation*}
$$

Proposition 3. Assume $f=0$. If $A$ is $B$-bounded and $\gamma \leqslant \frac{1}{\left\|A B^{-1}\right\|}$, then for every $\delta \in(0, \gamma)$ there exists $C>0$ such that for all $t \geqslant 0$ and $\varepsilon \in\left(0, \varepsilon_{0}\right)$ the following estimate holds:

$$
\begin{equation*}
\left\|u_{\varepsilon}(t)-u_{0}(t)\right\| \leqslant C\left[\varepsilon\left(\left\|u_{0 \varepsilon}\right\|+\left\|A^{-1} u_{1 \varepsilon}\right\|\right)+\mathrm{e}^{-(\gamma-\delta) t}\left\|u_{0 \varepsilon}-u_{00}\right\|\right] . \tag{7}
\end{equation*}
$$

The estimates (4)-(7) represent a strengthening of the results from [1] under the present assumptions.

Next we consider a general $f$. In addition to (A1) we assume

$$
\begin{equation*}
B \text { is } A \text {-bounded, } \tag{8}
\end{equation*}
$$

(A3) the mapping $f: D(f) \rightarrow X$ is defined on $D(f) \supset D\left(B^{1 / 2}\right)$ and
a) $f$ is the Gateaux derivative of a positive convex functional $F$ in $X$ with the domain $D(F) \supset D\left(B^{1 / 2}\right)$,
b) $f$ is a locally Lipschitz mapping from $D\left(B^{1 / 2}\right)$ into $X$ in the following sense: for every $R>0$ there exists $C>0$ such that $\left\|A^{1 / 2} u\right\| \leqslant R,\left\|A^{1 / 2} v\right\| \leqslant R$ imply

$$
\begin{equation*}
\|f(u)-f(v)\| \leqslant C\left\|B^{1 / 2}(u-v)\right\| \tag{9}
\end{equation*}
$$

(A4) $u_{0 \varepsilon} \in D(A)(\varepsilon \geqslant 0), u_{1 \varepsilon} \in D\left(A^{1 / 2}\right) \cap D(B)(\varepsilon>0)$, (A5) $\sup _{\varepsilon}\left(\varepsilon^{1 / 2}\left\|u_{1 \varepsilon}\right\|+\left\|A^{1 / 2} u_{0 \varepsilon}\right\|+F\left(u_{0 \varepsilon}\right)\right)<\infty$, (A6) $\lim _{\varepsilon \rightarrow 0} B^{1 / 2}\left(u_{0 \varepsilon}-u_{00}\right)=0$.

It was shown in [3] that under the assumptions (A3)-(A6) the equation (1) has a global classical solution $u_{\varepsilon}$ and the equation (2) has a global classical solution $u_{0}$. The following theorem will be proved.

Theorem 4. Assume (A2)-(A6). Then there exist $C>0$ and $\varepsilon_{0}>0$ such that for every $\beta \in[0,1)$ there is $K_{\beta}>0$ with the property that the estimate

$$
\begin{equation*}
\left\|B^{1 / 2}\left[u_{\varepsilon}(t)-u_{0}(t)\right]\right\| \leqslant C \mathrm{e}^{K_{\beta} t}\left[\varepsilon\left(1+t+\left\|u_{1 \varepsilon}\right\|\right)+\varepsilon^{\beta} t^{1-\beta}+\left\|B^{1 / 2}\left(u_{0 \varepsilon}-u_{00}\right)\right\|\right] \tag{10}
\end{equation*}
$$

holds.

## 2. The linear case

We first consider the initial value problems (1) and (2) with $f=0$.
Since $A$ and $B$ are commuting self-adjoint operators, there exists a self-adjoint operator $K$ in $X$ and positive measurable functions $a$ and $b$ on $\sigma=\sigma(K)$ such that $A=a(K), B=b(K)$. The assumption (A1) implies the existence of positive numbers $\mu$ and $b_{0}$ such that

$$
\begin{equation*}
0<b_{0} \leqslant b(\lambda) \leqslant \mu a(\lambda)^{2} \quad(\lambda \in \sigma) \tag{11}
\end{equation*}
$$

Setting

$$
\begin{equation*}
\varepsilon_{0}=\frac{3}{16 \mu} \tag{12}
\end{equation*}
$$

and $q_{\varepsilon}(\lambda)=a(\lambda)^{2}-4 \varepsilon b(\lambda)$, we conclude $q_{\varepsilon}(\lambda) \geqslant a(\lambda)^{2}-4 \varepsilon \mu a(\lambda)^{2}=\left(1-\frac{3 \varepsilon}{4 \varepsilon_{0}}\right) a(\lambda)^{2} \geqslant$ $\frac{1}{4} a(\lambda)^{2}$ if $\lambda \in \sigma$ and $\varepsilon \leqslant \varepsilon_{0}$, i.e.

$$
\begin{equation*}
\sqrt{q_{\varepsilon}(\lambda)} \geqslant \frac{1}{2} a(\lambda) \geqslant \sqrt{\frac{b_{0}}{4 \mu}} \quad\left(0 \leqslant \varepsilon<\varepsilon_{0}, \lambda \in \sigma\right) \tag{13}
\end{equation*}
$$

It was shown in [3] that if the condition (13) is satisfied, then the difference $u_{\varepsilon}(t)-$ $u_{0}(t)$ can be represented as

$$
\begin{equation*}
u_{\varepsilon}(t)-u_{0}(t)=f_{\varepsilon}(t, K) u_{0 \varepsilon}+s_{\varepsilon}(t, K) u_{1 \varepsilon}+\mathrm{e}^{-t B A^{-1}}\left(u_{0 \varepsilon}-u_{00}\right), \tag{14}
\end{equation*}
$$

where

$$
\begin{gathered}
f_{\varepsilon}(t, \lambda)=\frac{a(\lambda) \mathrm{e}^{-\frac{t a(\lambda)}{2 \varepsilon}} \operatorname{sh} \frac{t}{2 \varepsilon} \sqrt{q_{\varepsilon}(\lambda)}}{\sqrt{q_{\varepsilon}(\lambda)}}+\mathrm{e}^{-\frac{t a(\lambda)}{2 \varepsilon}} \operatorname{ch} \frac{t}{2 \varepsilon} \sqrt{q_{\varepsilon}(\lambda)}-\mathrm{e}^{-\frac{t b(\lambda)}{a(\lambda)}}, \\
s_{\varepsilon}(t, \lambda)=\frac{2 \varepsilon \mathrm{e}^{-\frac{t a(\lambda)}{2 \varepsilon}} \operatorname{sh} \frac{t}{2 \varepsilon} \sqrt{q_{\varepsilon}(\lambda)}}{\sqrt{q_{\varepsilon}(\lambda)}} .
\end{gathered}
$$

In order to estimate $u_{\varepsilon}-u_{0}$, we need a precise estimates of $\sup _{\lambda \in \sigma}\left|f_{\varepsilon}(t, \lambda)\right|, \sup _{\lambda \in \sigma}\left|s_{\varepsilon}(t, \lambda)\right|$. Note that the functions $(\varepsilon, t) \mapsto f_{\varepsilon}(t, \lambda), s_{\varepsilon}(t, \lambda)$ are not $C^{1}$ at $(0,0)$, which makes it hard to find uniform estimates without the condition (11). This is why we imposed the condition (3), which implies (13). The functions $f_{\varepsilon}(t, \lambda), s_{\varepsilon}(t, \lambda)$ are well behaved under the condition (13), and this will enable us to deduce the estimates (4)-(7).

We first prove the announced estimates of $f_{\varepsilon}$ and $s_{\varepsilon}$.
Lemma 5. There exists $C>0$ such that the estimate

$$
\begin{equation*}
\left|f_{\varepsilon}(t, \lambda)\right| \leqslant C \varepsilon\left[1+\frac{t b(\lambda)}{a(\lambda)}\right] \mathrm{e}^{-\frac{t b(\lambda)}{a(\lambda)}} \tag{15}
\end{equation*}
$$

holds for all $\lambda \in \sigma, t \geqslant 0$ and $\varepsilon \in\left(0, \varepsilon_{0}\right)$.

Proof. Denote $m_{\varepsilon}(\lambda):=a(\lambda)+\sqrt{q_{\varepsilon}(\lambda)}$; then $m_{\varepsilon}(\lambda) \geqslant \frac{3 a(\lambda)}{2}$ by (13). Fix $\lambda \in \sigma$ and denote

$$
b:=b(\lambda), a:=a(\lambda), q_{\varepsilon}:=q_{\varepsilon}(\lambda), m_{\varepsilon}:=m_{\varepsilon}(\lambda), f_{\varepsilon}(t):=f_{\varepsilon}(t, \lambda) .
$$

Note that

$$
\mathrm{e}^{-\frac{t a}{2 \varepsilon}} \mathrm{e}^{\frac{t}{2 \varepsilon} \sqrt{q_{\varepsilon}}}=\mathrm{e}^{-\frac{2 t b}{m \varepsilon}}, \mathrm{e}^{-\frac{t a}{2 \varepsilon}} \mathrm{e}^{-\frac{t}{2 \varepsilon} \sqrt{q_{\varepsilon}}}=\mathrm{e}^{-\frac{t m_{\varepsilon}}{2 \varepsilon}},
$$

which implies

$$
\begin{aligned}
& \mathrm{e}^{-\frac{t a}{2 \varepsilon}} \mathrm{e}^{\frac{t}{2 \varepsilon} \sqrt{q_{\varepsilon}}}-\mathrm{e}^{-\frac{t b}{a}}=\mathrm{e}^{-\frac{t b}{a}}\left(\mathrm{e}^{-\frac{4 \varepsilon t b^{2}}{a m_{\varepsilon}^{2}}}-1\right) \\
& \mathrm{e}^{-\frac{t a}{2 \varepsilon}} \mathrm{e}^{-\frac{t}{2 \varepsilon} \sqrt{q_{\varepsilon}}}-\mathrm{e}^{-\frac{t b}{a}}=\mathrm{e}^{-\frac{t b}{a}}\left(\mathrm{e}^{-\frac{t m_{\varepsilon}^{2}}{4 a \varepsilon}}-1\right)
\end{aligned}
$$

Define

$$
g(\varepsilon, t)=2 \mathrm{e}^{\frac{t b}{a}} f_{\varepsilon}(t)
$$

Note that $g(\cdot, t) \in C^{1}\left[0, \varepsilon_{0}\right)$ for all $t \geqslant 0$ (because of (13)) and that $g$ can be represented as

$$
\begin{equation*}
g(\varepsilon, t)=\frac{m_{\varepsilon}}{\sqrt{q_{\varepsilon}}} \mathrm{e}^{-\frac{4 \varepsilon t b^{2}}{a m_{\varepsilon}^{2}}}-\frac{4 \varepsilon b}{m_{\varepsilon} \sqrt{q_{\varepsilon}}} \mathrm{e}^{-\frac{t m_{\varepsilon}^{2}}{4 a \varepsilon}}-2 \tag{16}
\end{equation*}
$$

Differentiating, we find

$$
\begin{aligned}
-\frac{\partial g(\varepsilon, t)}{\partial \varepsilon}= & \frac{2 b}{q_{\varepsilon}} \mathrm{e}^{-\frac{4 \varepsilon t b^{2}}{a m_{\varepsilon}^{2}}}\left(-\frac{a}{\sqrt{q_{\varepsilon}}}+\frac{2 t b m_{\varepsilon} \sqrt{q_{\varepsilon}}+8 t b^{2} \varepsilon}{a m_{\varepsilon}^{2}}\right) \\
& +\frac{b}{q_{\varepsilon}} \mathrm{e}^{-\frac{t m_{\varepsilon}^{2}}{4 a \varepsilon}}\left(\frac{8 b \varepsilon}{m_{\varepsilon} \sqrt{q_{\varepsilon}}}+\frac{8 b \varepsilon}{m_{\varepsilon}^{2}}+\frac{4 \sqrt{q_{\varepsilon}}}{m_{\varepsilon}}+\frac{4 b t}{a}+\frac{t m_{\varepsilon} \sqrt{q_{\varepsilon}}}{a \varepsilon}\right) .
\end{aligned}
$$

Using (13), this implies

$$
\begin{aligned}
\left|\frac{\partial g(\varepsilon, t)}{\partial \varepsilon}\right| \leqslant & 16 \mu \frac{4 \varepsilon t b^{2}}{a m_{\varepsilon}^{2}} \mathrm{e}^{-\frac{4 \varepsilon t b^{2}}{a m_{\varepsilon}^{2}}}+16 \mu+\frac{256 \mu^{2}}{9} \frac{b t}{a} \\
& +\left(\frac{16 \mu}{3}+\frac{256 \mu^{2}}{9} \varepsilon\right) \frac{t m_{\varepsilon}^{2}}{4 a \varepsilon} \mathrm{e}^{-\frac{t m_{\varepsilon}^{2}}{4 a \varepsilon}}+\frac{512}{9} \mu^{2} \varepsilon+\frac{16 \mu}{3}
\end{aligned}
$$

Denote $r(x)=x \mathrm{e}^{-x}$. It follows that

$$
\begin{equation*}
\left|\frac{\partial g(\varepsilon, t)}{\partial \varepsilon}\right| \leqslant C\left[r\left(\frac{4 \varepsilon t b^{2}}{a m_{\varepsilon}^{2}}\right)+1+\frac{b t}{a}+r\left(\frac{t m_{\varepsilon}^{2}}{4 a \varepsilon}\right)\right] \tag{17}
\end{equation*}
$$

Note that $r(0)=0$ and $r(x) \leqslant 1(x>0)$. From $g(0, t)=0(t \geqslant 0)$ it follows that

$$
|g(\varepsilon, t)| \leqslant \varepsilon \max _{0<\delta<\varepsilon}\left|\frac{\partial g}{\partial \varepsilon}(\delta, t)\right| .
$$

Hence

$$
\left|f_{\varepsilon}(t)\right|=\frac{1}{2} \mathrm{e}^{-\frac{t b}{a}}|g(\varepsilon, t)| \leqslant C \varepsilon\left[\left(1+\tilde{r}_{a, b}(\varepsilon, t)\right) \mathrm{e}^{-\frac{t b}{a}}+r\left(\frac{b t}{a}\right)\right]
$$

with $C$ independent of $a$ and $b, \tilde{r}_{a, b}(\varepsilon, 0)=0$ and $0 \leqslant \tilde{r}_{a, b}(\varepsilon, t) \leqslant 1$. This implies (15).

Lemma 6. Let $\beta \geqslant 0$. There exists $C>0$ such that the estimate

$$
\begin{equation*}
\left|\frac{1}{\varepsilon} s_{\varepsilon}(t, \lambda)-\frac{1}{a(\lambda)} \mathrm{e}^{-\frac{t b(\lambda)}{a(\lambda)}}\right| \leqslant C\left[\frac{\varepsilon}{a(\lambda)}+\frac{\varepsilon^{\beta}}{a(\lambda)^{1+\beta} t^{\beta}}\right] \tag{18}
\end{equation*}
$$

holds for all $\lambda \in \sigma, t \geqslant 0$ and $\varepsilon \in\left(0, \varepsilon_{0}\right)$.
Proof. Fix $\lambda$ and recall the notation $a, b, q_{\varepsilon}, m_{\varepsilon}$ from Lemma 5. Further denote $s_{\varepsilon}(t):=s_{\varepsilon}(t, \lambda)$ and

$$
k(\varepsilon, t)=\frac{\sqrt{q_{\varepsilon}}}{a} \mathrm{e}^{\frac{t b}{a}}\left[\frac{a}{\varepsilon} s_{\varepsilon}(t)-\frac{a}{\sqrt{q_{\varepsilon}}} \mathrm{e}^{-\frac{t b}{a}}\right]
$$

Then $k=k_{1}+k_{2}$ with

$$
k_{1}(\varepsilon, t)=\mathrm{e}^{-\frac{4 t b^{2} \varepsilon}{a m_{\varepsilon}^{2}}}-1, k_{2}(\varepsilon, t)=-\mathrm{e}^{-\frac{t m_{\varepsilon}^{2}}{4 a \varepsilon}} .
$$

From

$$
-\frac{\partial k_{1}(\varepsilon, t)}{\partial \varepsilon}=\frac{4 t b^{2}}{a m_{\varepsilon}^{3} \sqrt{q_{\varepsilon}}}\left(m_{\varepsilon} \sqrt{q_{\varepsilon}}+4 b \varepsilon\right) \mathrm{e}^{-\frac{4 t b^{2} \varepsilon}{a m_{\varepsilon}^{2}}}
$$

it follows that $\left|\frac{\partial k_{1}}{\partial \varepsilon}(\varepsilon, t)\right| \leqslant \frac{4 t b^{2}}{a m_{\varepsilon}^{2}}+\frac{4 b}{m_{\varepsilon}} \sqrt{q_{\varepsilon}} r\left(\frac{4 t b^{2} \varepsilon}{a m_{\varepsilon}^{2}}\right)$. From (13) it follows that $\left|\frac{\partial k_{1}(\varepsilon, t)}{\partial \varepsilon}\right| \leqslant$ $C\left(\frac{t b}{a}+1\right)$. Since $k_{1}(0, t)=0$ for all $t \geqslant 0$, we conclude $\frac{a}{\sqrt{q_{\varepsilon}}} \mathrm{e}^{-\frac{t b}{a}}\left|k_{1}(\varepsilon, t)\right| \leqslant C \varepsilon$.

Further, note that $x^{\beta} \mathrm{e}^{-x} \leqslant C_{\beta}(x \geqslant 0)$, hence $\left(\frac{t m_{\varepsilon}^{2}}{4 a \varepsilon}\right)^{\beta}\left|k_{2}(\varepsilon, t)\right| \leqslant C_{\beta}$, implying $\frac{a}{\sqrt{q_{\varepsilon}}} \mathrm{e}^{-\frac{t b}{a}}\left|k_{2}(\varepsilon, t)\right| \leqslant C_{\beta}\left(\frac{\varepsilon}{a t}\right)^{\beta}$. This yields

$$
\begin{aligned}
\left|\frac{1}{\varepsilon} s_{\varepsilon}(t)-\frac{1}{a} \mathrm{e}^{-\frac{t b}{a}}\right| & =\left|\frac{1}{a}\left[\frac{a}{\varepsilon} s_{\varepsilon}(t)-\frac{a}{\sqrt{q_{\varepsilon}}} \mathrm{e}^{-\frac{t b}{a}}\right]+\left(\frac{1}{\sqrt{q_{\varepsilon}}}-\frac{1}{a}\right) \mathrm{e}^{-\frac{t b}{a}}\right| \\
& \leqslant C_{\beta} \frac{\varepsilon^{\beta}}{a(a t)^{\beta}}+C \frac{\varepsilon}{a}+\frac{4 \varepsilon b}{a m_{\varepsilon} \sqrt{q_{\varepsilon}}} \mathrm{e}^{-\frac{t b}{a}}
\end{aligned}
$$

and this implies (18).
Setting $\beta=0$, we obtain
Corollary 7. There exists $C>0$ such that the estimate

$$
\begin{equation*}
a(\lambda)\left|s_{\varepsilon}(t, \lambda)\right| \leqslant C \varepsilon \tag{19}
\end{equation*}
$$

holds for all $\lambda \in \sigma, t \geqslant 0$ and $\varepsilon \in\left(0, \varepsilon_{0}\right)$.

Proof of Theorem 1. The estimate (4) is a direct consequence of (14), (15) and (19).

Proof of Proposition 2. The estimate (5) is a direct consequence of (4). To estimate $u_{\varepsilon}^{\prime}-u_{0}^{\prime}$, note that $u_{\varepsilon}^{\prime}=v_{\varepsilon}$ is a solution of (1) with $f=0, v(0)=u_{1 \varepsilon}$, $v_{t}(0)=-\frac{1}{\varepsilon}\left(B u_{0 \varepsilon}+A u_{1 \varepsilon}\right)$ and that $u_{0}^{\prime}=v_{0}$ is the solution of (2) with $f=0, v(0)=$ $-A^{-1} B u_{00}$. Inserting these initial data into (5) and using $t\left\|B A^{-1} \mathrm{e}^{-t B A^{-1}}\right\| \leqslant 1$, we obtain (6).

Proof of Proposition 3. The estimate (7) is a direct consequence of (4), $\left\|\mathrm{e}^{-t B A^{-1}}\right\| \leqslant \mathrm{e}^{-t \gamma}$ and of

$$
\begin{aligned}
t\left\|B A^{-1} \mathrm{e}^{-t B A^{-1}}\right\| & \leqslant \sup _{\lambda \in \sigma} t \frac{b(\lambda)}{a(\lambda)} \mathrm{e}^{-\frac{t b(\lambda)}{a(\lambda)}} \\
& \leqslant \sup _{x \geqslant \gamma} t x \mathrm{e}^{-t x} \leqslant C_{\delta} \mathrm{e}^{-(\gamma-\delta) t}
\end{aligned}
$$

We end this Section by estimating the difference of the solutions of nonhomogeneous equations. Besides being of independent interest, this estimate is needed in the next Section.

Let $f_{\varepsilon}(\varepsilon \geqslant 0)$ be continuous $X$-valued functions and let $u_{\varepsilon}(\varepsilon>0)$ be the mild solution (see [3]) of

$$
\begin{equation*}
\varepsilon u_{t t}+A u_{t}+B u=f_{\varepsilon}, \quad u(0)=0, \quad u_{t}(0)=0 \tag{20}
\end{equation*}
$$

and let $u_{0}$ be the solution of

$$
\begin{equation*}
A u_{t}+B u=f_{0}, u(0)=0 \tag{21}
\end{equation*}
$$

Proposition 8. Let $\beta \in(0,1)$. There exists $C>0$ such that the estimate

$$
\begin{equation*}
\left\|B^{1 / 2}\left(u_{\varepsilon}(t)-u_{0}(t)\right)\right\| \leqslant C\left[\left\|f_{\varepsilon}-f_{0}\right\|_{L^{1}([0, t], X)}+\left(\varepsilon t+\varepsilon^{\beta} t^{1-\beta}\right)\left\|f_{0}\right\|_{C([0, t], X)}\right] \tag{22}
\end{equation*}
$$

holds for all $t \geqslant 0$ and $\varepsilon \in\left(0, \varepsilon_{0}\right)$.
Proof. The difference $u_{\varepsilon}-u_{0}$ is estimated using the identity

$$
\begin{aligned}
& u_{\varepsilon}(t)-u_{0}(t) \\
& \quad=\frac{1}{\varepsilon} \int_{0}^{t} S_{\varepsilon}(t-s)\left[f_{\varepsilon}(s)-f_{0}(s)\right] \mathrm{d} s+\int_{0}^{t}\left[\frac{1}{\varepsilon} S_{\varepsilon}(t-s)-A^{-1} \mathrm{e}^{-(t-s) B A^{-1}}\right] f_{0}(s) \mathrm{d} s
\end{aligned}
$$

where $S_{\varepsilon}(t)=s_{\varepsilon}(t, K)$. The first term is estimated using (19):

$$
\begin{aligned}
& \int_{0}^{t}\left\|\frac{1}{\varepsilon} B^{1 / 2} S_{\varepsilon}(t-s)\left[f_{\varepsilon}(s)-f_{0}(s)\right]\right\| \mathrm{d} s \\
& \leqslant\left\|B^{1 / 2} A^{-1}\right\| \int_{0}^{t}\left\|\frac{1}{\varepsilon} A S_{\varepsilon}(t-s)\right\|\left\|f_{\varepsilon}(s)-f_{0}(s)\right\| \mathrm{d} s \leqslant C \int_{0}^{t}\left\|f_{\varepsilon}(s)-f_{0}(s)\right\| \mathrm{d} s
\end{aligned}
$$

and the second term by (18):

$$
\begin{aligned}
& \int_{0}^{t}\left\|B^{1 / 2}\left[\frac{1}{\varepsilon} S_{\varepsilon}(t-s)-A^{-1} \mathrm{e}^{-(t-s) B A^{-1}}\right] f_{0}(s)\right\| \mathrm{d} s \\
& \leqslant C\left\|B^{1 / 2} A^{-1}\right\| \int_{0}^{t}\left(\varepsilon+\varepsilon^{\beta}\left\|A^{-\beta}\right\|(t-s)^{-\beta}\right)\left\|f_{0}(s)\right\| \mathrm{d} s
\end{aligned}
$$

This implies (22).
If $f_{\varepsilon}$ and $f_{0}$ are $C^{1}$-functions then we can apply (22) to the differentiated initial value problems to obtain an estimate for $\left\|B^{1 / 2}\left(u_{\varepsilon}^{\prime}(t)-u_{0}^{\prime}(t)\right)\right\|$. The precise statement is omitted.

## 3. Proof of Theorem 4

The existence of a continuous $D\left(B^{1 / 2}\right)$-valued global classical solution follows from Proposition 6 in [3] (with $Z=B^{1 / 2}$ ). We estimate

$$
\left\|B^{1 / 2}\left(u_{\varepsilon}(t)-u_{0}(t)\right)\right\| \leqslant \sum_{i=1}^{5} l_{\varepsilon}^{(i)}(t)
$$

with

$$
\begin{aligned}
& l_{\varepsilon}^{(1)}(t)=\left\|B^{1 / 2}\left[C_{\varepsilon}(t)-C_{0}(t)\right] u_{00}\right\| \\
& l_{\varepsilon}^{(2)}(t)=\left\|B^{1 / 2} C_{\varepsilon}(t)\left(u_{0 \varepsilon}-u_{00}\right)\right\| \\
& l_{\varepsilon}^{(3)}(t)=\left\|B^{1 / 2} S_{\varepsilon}(t) u_{1 \varepsilon}\right\| \\
& l_{\varepsilon}^{(4)}(t)=\int_{0}^{t}\left\|B^{1 / 2}\left[\frac{1}{\varepsilon} S_{\varepsilon}(t-s)-A^{-1} C_{0}(t-s)\right] f\left(u_{0}(s)\right)\right\| \mathrm{d} s \\
& l_{\varepsilon}^{(5)}(t)=\frac{1}{\varepsilon} \int_{0}^{t}\left\|B^{1 / 2} S_{\varepsilon}(t-s)\left[f\left(u_{\varepsilon}(s)\right)-f\left(u_{0}(s)\right)\right]\right\| \mathrm{d} s
\end{aligned}
$$

From (5) it follows that

$$
l_{\varepsilon}^{(1)}(t) \leqslant C \varepsilon\left\|B^{1 / 2} u_{00}\right\|, l_{\varepsilon}^{(2)}(t) \leqslant C\left\|B^{1 / 2}\left(u_{0 \varepsilon}-u_{00}\right)\right\|
$$

and

$$
l_{\varepsilon}^{(3)}(t) \leqslant C \varepsilon\left\|u_{1 \varepsilon}\right\| .
$$

From (22) it follows that

$$
l_{\varepsilon}^{(4)}(t) \leqslant C\left\|f\left(u_{0}\right)\right\|_{C([0, t], X)}\left(\varepsilon t+\varepsilon^{\beta} t^{1-\beta}\right)
$$

and

$$
l_{\varepsilon}^{(5)}(t) \leqslant \int_{0}^{t} \| f\left(u_{\varepsilon}(s)-f\left(u_{0}(s)\right) \| \mathrm{d} s\right.
$$

Since $\left\|A^{1 / 2} u_{\varepsilon}(t)\right\|$ is bounded independently of $\varepsilon$ and $t$ by the energy inequality (see [3], p. 101), it follows from (9) that

$$
l_{\varepsilon}^{(5)}(t) \leqslant C \int_{0}^{t}\left\|B^{1 / 2}\left(u_{\varepsilon}(s)-u_{0}(s)\right)\right\| \mathrm{d} s
$$

Applying Gronwall's lemma we find (10).
