# BOUNDARY FUNCTIONS ON A BOUNDED BALANCED DOMAIN 

Piotr Kot, Krakow

(Received June 20, 2007)

#### Abstract

We solve the following Dirichlet problem on the bounded balanced domain $\Omega$ with some additional properties: For $p>0$ and a positive lower semi-continuous function $u$ on $\partial \Omega$ with $u(z)=u(\lambda z)$ for $|\lambda|=1, z \in \partial \Omega$ we construct a holomorphic function $f \in \mathbb{O}(\Omega)$ such that $u(z)=\int_{\mathbb{D} z}|f|^{p} d \mathfrak{L}_{\mathbb{D} z}^{2}$ for $z \in \partial \Omega$, where $\mathbb{D}=\{\lambda \in \mathbb{C}:|\lambda|<1\}$.

Keywords: boundary behavior of holomorphic functions, exceptional sets, boundary functions, Dirichlet problem, Radon inversion problem

MSC 2010: 30B30

## 1. Preface

Let us denote $\mathbb{D}=\{\lambda \in \mathbb{C}:|\lambda|<1\}$. Assume that $\Omega \subset \mathbb{C}^{n}$ is a bounded balanced domain (i.e. $\mathbb{D} \Omega=\Omega$ ). We solve the following Dirichlet problem: For $p>0$ and a positive lower semi-continuous function $u$ on $\partial \Omega$ with $u(z)=u(\lambda z)$ for $|\lambda|=1, z \in \partial \Omega$ we construct a holomorphic function ${ }^{1} f \in \mathbb{O}(\Omega)$ such that ${ }^{2}$ $u(z)=\int_{\mathbb{D} z}|f|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}$ for $z \in \partial \Omega$. The case when $p=2$ and $\Omega$ is a unit ball $\mathbb{B}^{n}$ was solved in the paper [6, Theorem 2.9]. Now we generalize this result. In fact, our methods can be used for a bounded balanced domain $\Omega$ wich fulfils the following

Condition 1. There exists a positive constant $\theta$ and a natural number $K$ such that if a function $g$ is continuous on $\partial \Omega$ and $g(z)=g(\lambda z)>0$ when $|\lambda|=1$, $z \in \partial \Omega$, then there exists a natural number $N_{0}$ and a sequence of homogeneous polynomials $p_{m}$ of degree $m$ such that
(1) $\left|p_{m}(z)\right|<g(z)$ for $m>N_{0}$ and $z \in \partial \Omega$,
(2) $\theta g(z)<\max _{j=0,1, \ldots, K-1}\left|p_{m K+j}(z)\right|$ for $m>N_{0}$ and $z \in \partial \Omega$.

[^0]The above condition is true when $\Omega$ is the unit ball $\mathbb{B}^{n}$ (see [7, Theorem 2.7]). However, the last construction of homogeneous polynomials [7, Lemma 2.5] suggests that Condition 1 will be satisfied in more complicated domains. In fact, it will be fulfilled (see [8, Theorem 2.5]) at least for the class of bounded circular strictly convex domains with $C^{2}$ boundary. The result [ 6 , Theorem 2.7] was proved by using some properties of homogeneous polynomials on the unit ball while in [7] we constructed similar polynomials in the case when $\Omega$ is a bounded circular strictly convex domain with $C^{2}$ boundary. For this reason Condition 1 is the main assumption for the present paper.

Our construction is to enable us to give a simple description of exceptional sets of the form

$$
E^{p}(f)=\left\{z \in \partial \Omega: \int_{\mathbb{D} z}|f|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}=\infty\right\} .
$$

The exceptional sets were presented in the papers: [1], [2], [3], [4], [5], [6], [7].

## 2. Solution

The following fact will simplify the integration of holomorphic functions.

Lemma 1. Assume that $p>0, f \in C(\bar{\Omega}), \varepsilon, \delta \in(0,1)$. If $g_{m} \in C(\bar{\Omega})$ and $g_{m} \rightarrow 0$ uniformly on any compact subset of $\Omega$, then there exists $m_{0}$ such that

$$
\begin{aligned}
& \int_{\mathbb{D} z}\left|f+g_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2} \geqslant-\varepsilon+\int_{\mathbb{D} z}|f|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}+\delta^{p} \int_{\mathbb{D} z}\left|g_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}, \\
& \int_{\mathbb{D} z}\left|f+g_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2} \leqslant \varepsilon+\int_{\mathbb{D} z}|f|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}+\delta^{-p} \int_{\mathbb{D} z}\left|g_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}
\end{aligned}
$$

for $m>m_{0}, z \in \partial \Omega$.
Proof. Let $M:=\sup _{z \in \Omega}|f(z)|$. There exists a number $r \in\left(\frac{1}{2}, 1\right)$ such that $\left(\pi\left(1-r^{2}\right) M^{p}\right) /(1-\delta)^{p} \leqslant \varepsilon / 8$. Let $D(z)=\{w \in \mathbb{D} z: r \leqslant\|w\|\}$. We consider the following function:

$$
\Psi: \partial \Omega \times \overline{\mathbb{D}} \ni(z, \xi) \rightarrow \int_{|\lambda| \leqslant r}|f(\lambda z)+\xi|^{p} \mathrm{~d} \mathfrak{L}^{2}(\lambda) .
$$

Since $\Omega$ is bounded and $\Psi$ continuous there exists $0<\alpha<\delta \sqrt[p]{\varepsilon / 4 \pi}$ with

$$
|\Psi(z, 0)-\Psi(z, \xi)| \leqslant \frac{\varepsilon}{4}
$$

for $z \in \partial \Omega$ and $|\xi| \leqslant \alpha$. Moreover, there exists $m_{0}$ such that $\left|g_{m}(z)\right| \leqslant \alpha$ for $m>m_{0}$ and $z \in r \Omega$. Let us observe that

$$
\begin{equation*}
\int_{r \mathbb{D} z}\left|g_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2} \leqslant \int_{\mathbb{D} z} \delta^{p}\left|\frac{\varepsilon}{4 \pi}\right| \mathrm{d} \mathfrak{L}_{\mathbb{D} z}^{2} \leqslant \frac{1}{4} \delta^{p} \varepsilon \tag{1}
\end{equation*}
$$

and

$$
\begin{equation*}
\int_{D(z)}|f|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2} \leqslant \int_{D(z)} M^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2} \leqslant \frac{1}{4} \varepsilon . \tag{2}
\end{equation*}
$$

Since $\left|g_{m}\right| \leqslant \alpha$ on $r \mathbb{D} z$ we have $\left|\Psi(w, 0)-\Psi\left(w, g_{m}(w)\right)\right| \leqslant \frac{\varepsilon}{4}$ for $w \in r \mathbb{D} z$. In particular, ${ }^{3}$

$$
\begin{aligned}
\int_{r \mathbb{D} z}\left|f+g_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2} & \geqslant-\frac{1}{4} \varepsilon+\int_{r \mathbb{D} z}|f|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2} \\
& \stackrel{(2)}{\geqslant}-\frac{1}{2} \varepsilon+\int_{r \mathbb{D} z}|f|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}+\delta^{p} \int_{r \mathbb{D} z}\left|g_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}
\end{aligned}
$$

and

$$
\begin{aligned}
\int_{r \mathbb{D} z}\left|f+g_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2} & \leqslant \frac{1}{4} \varepsilon+\int_{r \mathbb{D} z}|f|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2} \\
& \stackrel{(2)}{\leqslant} \frac{1}{2} \varepsilon+\int_{r \mathbb{D} z}|f|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}+\delta^{-p} \int_{r \mathbb{D} z}\left|g_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}
\end{aligned}
$$

Now we define the following sets:

$$
\begin{aligned}
B_{m, 1}(z) & :=\left\{w \in \mathbb{D} z: r \leqslant\|w\|,\left|\left(f+g_{m}\right)(w)\right| \geqslant \delta\left|g_{m}(w)\right|\right\} \\
B_{m, 2}(z) & :=\left\{w \in \mathbb{D} z: r \leqslant\|w\|,|f(w)|+\left|g_{m}(w)\right| \leqslant \delta^{-1}\left|g_{m}(w)\right|\right\} \\
C_{m, i}(z) & :=\left\{w \in \mathbb{D} z: r \leqslant\|w\|, w \notin B_{m, i}(z)\right\} .
\end{aligned}
$$

Let $w \in C_{m, 1}(z)$. Since $\left|\left(f+g_{m}\right)(w)\right|<\delta\left|g_{m}(w)\right|$ we have $(1-\delta)\left|g_{m}(w)\right| \leqslant|f(w)| \leqslant$ $M$ and

$$
\int_{C_{m, 1}(z)}\left|g_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2} \leqslant \int_{D(z)} \frac{M^{p}}{(1-\delta)^{p}} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2} \leqslant \frac{1}{8} \varepsilon
$$

We can estimate

$$
\begin{aligned}
\int_{D(z)}\left|f+g_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2} & \geqslant \int_{B_{m, 1}(z)}\left|f+g_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2} \\
& \geqslant \delta^{p} \int_{B_{m, 1}(z)}\left|g_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2} \geqslant-\frac{1}{4} \varepsilon+\delta^{p} \int_{D(z)}\left|g_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2} \\
& \geqslant-\frac{1}{2} \varepsilon+\int_{D(z)}|f|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}+\delta^{p} \int_{D(z)}\left|g_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}
\end{aligned}
$$

[^1]Let $w \in C_{m, 2}(z)$. Since $|f(w)|+\left|g_{m}(w)\right|>\delta^{-1}\left|g_{m}(w)\right|$ we have $\left(\delta^{-1}-1\right)\left|g_{m}(w)\right| \leqslant$ $|f(w)| \leqslant M$ and $|f(w)|+\left|g_{m}(w)\right|<M+\delta M /(1-\delta)=M /(1-\delta)$. So we may conclude

$$
\int_{C_{m, 2}(z)}\left|f+g_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2} \leqslant \int_{D(z)} \frac{M^{p}}{(1-\delta)^{p}} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2} \leqslant \frac{1}{8} \varepsilon
$$

This implies

$$
\begin{aligned}
\int_{D(z)}\left|f+g_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2} & \leqslant \frac{1}{8} \varepsilon+\int_{B_{m, 2}(z)}\left|f+g_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2} \\
& \leqslant \frac{1}{8} \varepsilon+\delta^{-p} \int_{B_{m, 2}(z)}\left|g_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2} \\
& \leqslant \frac{1}{2} \varepsilon+\int_{D(z)}|f|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}+\delta^{-p} \int_{D(z)}\left|g_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2},
\end{aligned}
$$

which completes the proof.
The next result will be the first approximation of our solution.

Lemma 2. There exists a constant $a \in(0,1)$ and a natural number $K$ such that if a function $h$ is continuous on $\partial \Omega$ and $h(z)=h(\lambda z)>0$ when $|\lambda|=1, z \in \partial \Omega$, then there exists a natural number $m_{0}$ and a sequence of homogeneous polynomials $q_{m}$ of degree $m$ such that

$$
\begin{align*}
& h(z)>\int_{\mathbb{D} z}\left|\sum_{j=0}^{K-1} q_{m K+j}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}>a h(z),  \tag{3}\\
& \quad m h(z) t^{m p}>\left|\sum_{j=0}^{K-1} q_{m K+j}(t z)\right|^{p}
\end{align*}
$$

for $z \in \partial \Omega, t>0$ and $m \geqslant m_{0}$.
Proof. Let $\theta$ and $K$ be from Condition 1. Let $\delta=\min \left\{p / 4 \pi K^{p}, 1 / 2^{p+1} K^{p}\right\}$. There exists a natural number $m_{0}>K$ and a sequence of homogeneous polynomials $p_{m}$ of degree $m$ such that $\left|p_{m}(z)\right|^{p}<\delta h(z)$ and $\theta^{p} \delta h(z)<\max _{j=0, \ldots, K-1}\left|p_{m K+j}(z)\right|^{p}$ for $z \in \partial \Omega$ and $m \geqslant m_{0}$. Let $q_{m}:=m^{1 / p} p_{m}, w_{m}:=\sum_{j=0}^{K-1} q_{m+j}$ and $I_{m, s, z}:=$ $\int_{\mathbb{D} z}\left|w_{m}\right|^{s} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}$.

Assume that $m_{0}$ is so large that $(m+j)^{1 / p} \leqslant 2 m^{1 / p}$ for $m \geqslant m_{0}, j=0, \ldots, K-1$. We then obtain the inequality (4):
(5) $\left|w_{m}(t z)\right| \leqslant \sum_{j=0}^{K-1}(m+j)^{1 / p} t^{m+j} \delta^{1 / p} h(z)^{1 / p} \leqslant 2(m \delta h(z))^{1 / p} K t^{m}<(m h(z))^{1 / p} t^{m}$
and conclude for the left-hand side of relation (3)

$$
\begin{aligned}
I_{m, p, z} & =\int_{0}^{1} \int_{0}^{2 \pi} t\left|w_{m}\left(t z \mathrm{e}^{\mathrm{i} \varphi}\right)\right|^{p} \mathrm{~d} t \mathrm{~d} \varphi \\
& \leqslant 4 \pi \delta K^{p} h(z) \int_{0}^{1} m t^{p m+1} \mathrm{~d} t<\frac{4 \pi \delta K^{p} h(z)}{p} \leqslant h(z)
\end{aligned}
$$

for $z \in \partial \Omega$.
Since $q_{m}, \ldots, q_{m+K-1}$ are homogeneous polynomials with degrees $m, m+1, \ldots$, $m+K-1$ we conclude that $q_{m}, \ldots, q_{m+K-1}$ are orthogonal polynomials, which implies that

$$
I_{m, 2, z}=\int_{\mathbb{D} z}\left|\sum_{j=0}^{K-1} q_{m+j}\right|^{2} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}=\sum_{j=0}^{K-1} \int_{\mathbb{D} z}\left|q_{m+j}\right|^{2} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2} .
$$

Let us observe that

$$
\begin{align*}
I_{m, 2, z} & =\sum_{j=0}^{K-1} \int_{\mathbb{D} z}\left|q_{m+j}\right|^{2} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2} \geqslant 2 \pi \int_{0}^{1}\left(m \theta^{p} \delta h(z)\right)^{2 / p} t^{2(m+K)-1} \mathrm{~d} t  \tag{6}\\
& \geqslant \frac{\pi \theta^{2}(m \delta h(z))^{2 / p}}{2 m} .
\end{align*}
$$

Now we define

$$
A(z):=\left\{\varphi \in[0,2 \pi]:\left|w_{m}\left(z \mathrm{e}^{\mathrm{i} \varphi}\right)\right|>\frac{1}{3} \theta(m \delta h(z))^{1 / p}\right\} .
$$

Since

$$
\begin{aligned}
\left|t^{m} w_{m}(z)-w_{m}(t z)\right| & \leqslant \sum_{k=m}^{m+K-1} k^{1 / p}\left|t^{m} p_{k}(z)-p_{k}(t z)\right| \\
& \leqslant \sum_{k=m}^{m+K-1} 2 m^{1 / p} t^{m}\left(1-t^{k-m}\right)\left|p_{k}(z)\right| \\
& \leqslant 2 m^{1 / p} t^{m}\left(1-t^{K}\right) K \max _{j=0, \ldots, K-1}\left|p_{m+j}(z)\right| \\
& \leqslant 2 m^{1 / p} t^{m}\left(1-t^{K}\right) K(\delta h(z))^{1 / p},
\end{aligned}
$$

there exists $r \in(0,1)$ such that

$$
\left|t^{m} w_{m}\left(z \mathrm{e}^{\mathrm{i} \varphi}\right)-w_{m}\left(t z \mathrm{e}^{\mathrm{i} \varphi}\right)\right| \leqslant \frac{1}{6} \theta(m \delta h(z))^{1 / p} t^{m}
$$

for $t \in(r, 1), z \in \partial \Omega$ and $m \geqslant m_{0}$. In particular, if $\varphi \in[0,2 \pi] \backslash A(z)$ then

$$
\left|w_{m}\left(t z \mathrm{e}^{\mathrm{i} \varphi}\right)\right| \leqslant\left|t^{m} w_{m}\left(z \mathrm{e}^{\mathrm{i} \varphi}\right)\right|+\left|t^{m} w_{m}\left(z \mathrm{e}^{\mathrm{i} \varphi}\right)-w_{m}\left(t z \mathrm{e}^{\mathrm{i} \varphi}\right)\right| \leqslant \frac{1}{2} \theta(m \delta h(z))^{1 / p} t^{m}
$$

for $t \in(r, 1)$. Let $c_{z}:=\mathfrak{L}(A(z))$. Now due to (5) we have

$$
\begin{aligned}
I_{m, 2, z} \leqslant & \int_{r}^{1} \int_{A(z)} 4(m \delta h(z))^{2 / p} K^{2} t^{2 m+1} \mathrm{~d} t \mathrm{~d} \varphi+\int_{r}^{1} \int_{[0,2 \pi] \backslash A(z)} t\left|w\left(t z \mathrm{e}^{\mathrm{i} \varphi}\right)\right|^{2} \mathrm{~d} t \mathrm{~d} \varphi \\
& +2 \pi \int_{0}^{r} 4(m \delta h(z))^{2 / p} K^{2} t^{2 m+1} \mathrm{~d} t \\
\leqslant & \frac{c_{z} 4(m \delta h(z))^{2 / p} K^{2}}{2 m+2}+\frac{\left(1-c_{z}\right) \theta^{2}(m \delta h(z))^{2 / p}}{4(2 m+2)}+\frac{8 \pi(m \delta h(z))^{2 / p} K^{2} r^{2 m+2}}{2 m+2},
\end{aligned}
$$

which together with (6) gives the inequality

$$
\pi \theta^{2} \leqslant c_{z} 4 K^{2}+\left(1-c_{z}\right) \frac{\theta^{2}}{4}+8 \pi K^{2} r^{2 m+2}
$$

In particular, if $m_{0}$ is so large that $8 \pi K^{2} r^{2 m_{0}+2}<\pi \theta^{2} / 2-\theta^{2} / 4$ then we can estimate $\pi \theta^{2} / 2 \leqslant c_{z}\left(4 K^{2}-\theta^{2} / 4\right)<c_{z} 4 K^{2}$ and conclude that $c_{z}>\pi \theta^{2} / 8 K^{2}$.

Let us observe that if $\varphi \in A(z)$ then

$$
\left|w_{m}\left(t z \mathrm{e}^{\mathrm{i} \varphi}\right)\right| \geqslant\left|t^{m} w_{m}\left(z \mathrm{e}^{\mathrm{i} \varphi}\right)\right|-\left|t^{m} w_{m}\left(z \mathrm{e}^{\mathrm{i} \varphi}\right)-w_{m}\left(t z \mathrm{e}^{\mathrm{i} \varphi}\right)\right| \geqslant \frac{1}{6} \theta(m \delta h(z))^{1 / p} t^{m}
$$

so we can set $a=\frac{1}{16}\left(\pi \theta^{2+p} \delta\right) /\left(K^{2} 6^{p} p\right)$ and conclude for the right-hand side of relation (3):

$$
\begin{aligned}
I_{m, p, z} & \geqslant \int_{r}^{1} \int_{A(z)} t\left|w\left(t z \mathrm{e}^{\mathrm{i} \varphi}\right)\right|^{p} \mathrm{~d} t \mathrm{~d} \varphi \\
& >\frac{\pi \theta^{2}}{8 K^{2}} \frac{\theta^{p} \delta h(z)}{6^{p}} \int_{r}^{1} m t^{p m+1} \mathrm{~d} t>\frac{\pi \theta^{2+p} \delta}{8 K^{2} 6^{p} 2 p} h(z) \geqslant a h(z)
\end{aligned}
$$

for $m \geqslant m_{0}$ and $m_{0}$ large enough.
We need also well Lemmas 3-4 to simplify our calculations.

Lemma 3. There exists a constant $\theta \in(0,1)$ and $K \in \mathbb{N}$ such that if $g$ is a complex continuous function on $\bar{\Omega}$ and $h$ is a positive continuous function on $\partial \Omega$ with $h(z)=h(\lambda z)>0$ when $|\lambda|=1, z \in \partial \Omega$, then there exists a natural number $m_{0}$ and a sequence of holomorphic polynomials $w_{m}$ such that

$$
\begin{gather*}
h(z)>\int_{\mathbb{D} z}\left|g+w_{m}\right|^{p}-|g|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}>\theta h(z),  \tag{7}\\
m t^{m p} h(z)>\left|w_{m}(t z)\right|^{p} \tag{8}
\end{gather*}
$$

for $z \in \partial \Omega, t \in(0,1], m \in K \mathbb{N} \backslash\left[0, m_{0}\right] .{ }^{4}$
Proof. Due to Lemma 2 there exist a constant $a \in(0,1)$, a natural number $m_{0}$ and a sequence of holomorphic polynomials $w_{m}$ such that

$$
\begin{gathered}
\frac{1}{2} h(z)>\int_{\mathbb{D} z}\left|w_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}>\frac{a}{2} h(z), \\
m t^{m p} h(z)>\left|w_{m}(t z)\right|^{p}
\end{gathered}
$$

for $z \in \partial \Omega, t \in(0,1], m \in K \mathbb{N} \backslash\left[0, m_{0}\right]$. Let $\varepsilon, \delta \in(0,1)$ be such that $\max \left\{1-\delta^{p}\right.$, $\left.\delta^{-p}-1\right\}<\frac{1}{4} a$ and $\varepsilon<\frac{1}{8} a h(z) \max \left\{1-\delta^{p}, \delta^{-p}-1\right\}<\frac{1}{4} a$ for $z \in \partial \Omega$. Since $w_{m} \rightarrow 0$ uniformly on any compact subset of $\Omega$ due to Lemma 1 we can increase $m_{0}$ in such a way that

$$
\begin{align*}
& \int_{\mathbb{D} z}\left|g+w_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2} \geqslant-\varepsilon+\int_{\mathbb{D} z}|g|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}+\delta^{p} \int_{\mathbb{D} z}\left|w_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2},  \tag{9}\\
& \int_{\mathbb{D} z}\left|g+w_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2} \leqslant \varepsilon+\int_{\mathbb{D} z}|g|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}+\delta^{-p} \int_{\mathbb{D} z}\left|w_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2} \tag{10}
\end{align*}
$$

for $m \in K \mathbb{N} \backslash\left[0, m_{0}\right]$.
Let us denote $I_{m, z}:=\int_{\mathbb{D} z}\left|g+w_{m}\right|^{p}-|g|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}$. Using (10) we may conclude for the left-hand side of inequality (7):

$$
\begin{aligned}
I_{m, z} & \leqslant \varepsilon+\int_{\mathbb{D} z}\left|w_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}+\left(\delta^{-p}-1\right) \int_{\mathbb{D} z}\left|w_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2} \\
& <\frac{a h(z)}{8}+\frac{h(z)}{2}+\frac{a h(z)}{8}<h(z) .
\end{aligned}
$$

Due to (9) we have for the right-hand side of inequality (7):

$$
\begin{aligned}
I_{m, z} & \geqslant-\varepsilon+\int_{\mathbb{D} z}\left|w_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}-\left(1-\delta^{p}\right) \int_{\mathbb{D} z}\left|w_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2} \\
& >-\frac{a h(z)}{8}+\frac{a h(z)}{2}-\frac{a h(z)}{8}=\frac{a h(z)}{4} .
\end{aligned}
$$

We have just proved that it is enough to choose $\theta=\frac{1}{4} a$.

[^2]Lemma 4. Let $\varepsilon>0$, let $h$ be a positive continuous function on $\partial \Omega$ with $h(z)=h(\lambda z)>0$ when $|\lambda|=1, z \in \partial \Omega$. Moreover, let $g$ be a complex continuous function on $\bar{\Omega}$ and $T$ a compact subset of $\Omega$. Then there exists a homolomorphic polynomial $w$ on $\Omega$ such that $h(z)-\varepsilon<\int_{\mathbb{D} z}|w+g|^{p}-|g|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}<h(z)$ for $z \in \partial \Omega$ and $\|w\|_{T}<\varepsilon$.

Proof. Due to Lemma 3 there exist a constant $\theta \in(0,1)$ and a sequence of holomorphic polynomials $w_{m}$ such that
(1) $\left\|w_{m}\right\|_{T}<\varepsilon / 2^{m+1}$.
(2) $\theta h_{m}(z)<\int_{\mathbb{D} z}\left|w_{m}+g_{m}\right|^{p}-\left|g_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}<h_{m}(z)$ for $z \in \partial \Omega$, where $h_{1}=h, g_{1}=g$,

$$
h_{m+1}(z)=h_{m}(z)-\left(\int_{\mathbb{D} z}\left|w_{m}+g_{m}\right|^{p}-\left|g_{m}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}\right) \text { and } g_{m+1}=\sum_{j=1}^{m} w_{m}+g
$$

Let us observe that $0<h_{m+1}(z)=h(z)-\left(\int_{\mathbb{D} z}\left|g_{m+1}\right|^{p}-|g|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}\right)$. Now due to (2) we can estimate

$$
0<h_{m+1}(z)=h_{m}(z)+\int_{\mathbb{D} z}\left|g_{m}\right|^{p}-\left|g_{m+1}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}<h_{m}(z)-\theta h_{m}(z)=(1-\theta) h_{m}
$$

Since $h_{m+1}(z)<(1-\theta)^{m} h_{1}(z)$ there exists $m_{0}$ so large that

$$
0<h_{m_{0}+1}(z)=h(z)-\left(\int_{\mathbb{D} z}\left|g_{m_{0}+1}\right|^{p}-|g|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}\right)<\varepsilon
$$

for $z \in \partial \Omega$. So it is enough to choose $w=\sum_{m=1}^{m_{0}} w_{m}$.
Now it is possible to present the main result of our paper:
Theorem 1. Let $u$ be a positive lower semi-continuous function on $\partial \Omega$ with $u(z)=u(\lambda z)>0$ when $|\lambda|=1, z \in \partial \Omega$. Then there exists a holomorphic function $f$ on $\Omega$ such that $u(z)=\int_{\mathbb{D} z}|f|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}$ for $z \in \partial \Omega$.

Proof. Let $T_{m}$ be an increasing sequence of compact subsets of $\Omega=\bigcup_{m \in \mathbb{N}} T_{m}$. There exists a sequence $u_{m}$ of continuous functions on $\partial \Omega$ with $u_{m}(z)=u_{m}(\lambda z)>0$ when $|\lambda|=1, z \in \partial \Omega$ and $u_{m} \nearrow u$. We construct a sequence of polynomials $w_{m}$ such that
(1) $\left\|w_{m}\right\|_{T_{m}}<1 / 2^{m+1}$,
(2) $u_{m}(z)-1 / 2^{m}<\int_{\mathbb{D} z}\left|\sum_{k=1}^{m} w_{k}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}<u_{m}(z)$ for $z \in \partial \Omega$.

To construct $w_{1}$ it is enough to use Lemma 4 for the data $(\varepsilon, h, g, T)=\left(\frac{1}{2}, u_{1}, 0, T_{1}\right)$. Assume that we have constructed $w_{1}, w_{2}, \ldots, w_{m}$. Now it is enough to choose a holomorphic polynomial $w_{m+1}$ from Lemma 4 used for the data

$$
(\varepsilon, h, g, T)=\left(\frac{1}{2^{m+1}}, h_{m+1}, \sum_{k=1}^{m} w_{k}, T_{m+1}\right)
$$

where $h_{m+1}(z)=u_{m+1}(z)-\int_{\mathbb{D} z}\left|\sum_{k=1}^{m} w_{k}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}$. We can observe that

$$
\begin{aligned}
& u_{m+1}(z)-\int_{\mathbb{D} z}\left|\sum_{k=1}^{m} w_{k}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}-\frac{1}{2^{m+1}} \\
& \quad<\int_{\mathbb{D} z}\left|\sum_{k=1}^{m+1} w_{k}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}-\int_{\mathbb{D} z}\left|\sum_{k=1}^{m} w_{k}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2}<u_{m+1}(z)-\int_{\mathbb{D} z}\left|\sum_{k=1}^{m} w_{k}\right|^{p} \mathrm{~d} \mathfrak{L}_{\mathbb{D} z}^{2} .
\end{aligned}
$$

To complete the proof it is enough to define $f=\sum_{k=1}^{\infty} w_{k}$.
Theorem 2. Let $E$ be a subset of type $G_{\delta}$ in $\partial \Omega$. There exists a holomorphic function $f$ such that $E=E^{p}(f)$ and $\int_{\Omega \backslash \mathbb{D} E}|f|^{p} \mathrm{~d} \mathfrak{L}^{\mathfrak{2 n}}<\infty$.

Proof. To prove this fact it is enough to combine Theorem 1 with the methods from [6, Theorem 3.1].
