# A METHOD OF CONSTRUCTING GENERAL CONTACT TANGENTIAL CHARTS 

Katuhiko Morita and Osamu Satō
(Received December 29, 1971)

## 1. Introduction

Concerning the contact tangential charts of three variables, Edward Otto [1] showed a method of obtaining the nomograms consisting of two curvilinear scales and a family of envelopes.

Recently, furthermore, Evžen Jokl [2] and Jaroslav Záhora [3] researched, respectively, the methods of constructing the contact tangential charts of three variables or more.

In this paper, the authors give another method of constructing general contact tangential charts, and show some examples of them.

## 2. General theory of contact tangential charts of three variables

In this article we consider a method of constructing the contact tangential chart of the general functional relation

$$
\begin{equation*}
F_{123}\left(t_{1}, t_{2}, t_{3}\right)=0, \tag{1}
\end{equation*}
$$

where $F_{123}$ is a real function of three real variables $t_{1}, t_{2}$ and $t_{3}$.
Firstly, we give the following two pairs of equations, involving the parameters $\alpha$ and $\beta$, respectively:

$$
\begin{equation*}
\left(t_{1}\right): \quad x=f_{1}\left(t_{1}, \alpha\right), \quad y=g_{1}\left(t_{1}, \alpha\right) ; \tag{2}
\end{equation*}
$$

$$
\begin{equation*}
\left(t_{2}\right): \quad x=f_{2}\left(t_{2}, \beta\right), \quad y=g_{2}\left(t_{2}, \beta\right), \tag{3}
\end{equation*}
$$

where we assume that $f_{1}, g_{1}$ and $f_{2}, g_{2}$ are continuous functions of $t_{1}$ and $t_{2}$, respectively, and also that they are of class $C^{1}$ with respect to $\alpha$ and $\beta$.

Then, the equation of the family of tangents of a $t_{1}$-curve of $\left(t_{1}\right)$-curves is expressed by

$$
\begin{equation*}
Y-g_{1}\left(t_{1}, \alpha\right)=\left(\frac{\partial g_{1}}{\partial \alpha} / \frac{\partial f_{1}}{\partial \alpha}\right)\left\{X-f_{1}\left(t_{1}, \alpha\right)\right\}, \tag{4}
\end{equation*}
$$

where $X, Y$ are current coordinates; and the equation of the family of tangents of a $t_{2}$-curve of $\left(t_{2}\right)$-curves is also, similarly, expressed by

$$
\begin{equation*}
Y-g_{2}\left(t_{2}, \beta\right)=\left(\frac{\partial g_{2}}{\partial \beta} / \frac{\partial f_{2}}{\partial \beta}\right)\left\{X-f_{2}\left(t_{2}, \beta\right)\right\} \tag{5}
\end{equation*}
$$

From (4) and (5), we have

$$
\begin{align*}
& \frac{\partial g_{1}}{\partial \alpha} X-\frac{\partial f_{1}}{\partial \alpha} Y+\frac{\partial f_{1}}{\partial \alpha} g_{1}-\frac{\partial g_{1}}{\partial \alpha} f_{1}=0, \\
& \frac{\partial g_{2}}{\partial \beta} X-\frac{\partial f_{2}}{\partial \beta} Y+\frac{\partial f_{2}}{\partial \beta} g_{2}-\frac{\partial g_{2}}{\partial \beta} f_{2}=0 .
\end{align*}
$$

Therefore, a necessary and sufficient condition that the two tangents expressed by $\left(4^{\prime}\right)$ and $\left(5^{\prime}\right)$ are the same is given by

$$
\begin{equation*}
\frac{\frac{\partial g_{1}}{\partial \alpha}}{\frac{\partial g_{2}}{\partial \beta}}=\frac{\frac{\partial f_{1}}{\partial \alpha}}{\frac{\partial f_{2}}{\partial \beta}}=\frac{\frac{\partial f_{1}}{\partial \alpha} g_{1}-\frac{\partial g_{1}}{\partial \alpha} f_{1}}{\frac{\partial f_{2}}{\partial \beta} g_{2}-\frac{\partial g_{2}}{\partial \beta} f_{2}} \tag{6}
\end{equation*}
$$

that is.

$$
\begin{equation*}
\frac{\partial g_{1}}{\partial \alpha} \frac{\partial f_{2}}{\partial \beta}-\frac{\partial f_{1}}{\partial \alpha} \frac{\partial g_{2}}{\partial \beta}=0 \tag{7}
\end{equation*}
$$

$$
\begin{equation*}
\frac{\partial g_{1}}{\partial \alpha}\left\{\frac{\partial \hat{f}_{2}}{\partial \beta} g_{2}-\frac{\partial g_{2}}{\partial \beta} f_{2}\right\}-\frac{\partial g_{2}}{\partial \beta}\left\{\frac{\partial f_{1}}{\partial \alpha} g_{1}-\frac{\partial g_{1}}{\partial \alpha} f_{1}\right\}=0 . \tag{8}
\end{equation*}
$$

Now considering (7) and (8) as a system of equations with respect to $\alpha$ and $\beta$, we have the following solutions:

$$
\begin{align*}
& \alpha=\alpha\left(t_{1}, t_{2}\right),  \tag{9}\\
& \beta=\beta\left(t_{1}, t_{2}\right) . \tag{10}
\end{align*}
$$

In general, the equation of the straight line passing through two points $\left\{f_{1}\left(t_{1}, \alpha\right)\right.$, $\left.g_{1}\left(t_{1} \cdot \alpha\right)\right\}$ and $\left\{f_{2}\left(t_{2}, \beta\right), g_{2}\left(t_{2}, \beta\right)\right\}$ is expressed by

$$
\begin{equation*}
Y-g_{1}\left(t_{1}, \alpha\right)=\frac{g_{2}\left(t_{2}, \beta\right)-g_{1}\left(t_{1}, \alpha\right)}{f_{2}\left(t_{2}, \beta\right)-f_{1}\left(t_{1}, \alpha\right)}\left\{X-f_{1}\left(t_{1}, \alpha\right)\right\} . \tag{11}
\end{equation*}
$$

Hence, substituting expressions (9) and (10) into (11), we have the equation of the common tangent of a $t_{1}$-curve and $t_{2}$-curve; that is, we have an equation of the form

$$
\begin{equation*}
Y-Y_{0}\left(t_{1}, t_{2}\right)=\Phi\left(t_{1}, t_{2}\right)\left\{X-X_{0}\left(t_{1}, t_{2}\right)\right\}, \tag{12}
\end{equation*}
$$

where $\Phi$ is a certain function of $t_{1}$ and $t_{2}$.
Next, solving (1) with respect to $t_{2}$ and putting $t_{3}=t_{3}^{(0)}=$ const., we have

$$
\begin{equation*}
t_{2}=f\left(t_{1}, t_{3}^{(0)}\right) \tag{13}
\end{equation*}
$$

Substituting (13) into (12), we obtain the equation of the family of tangents, with a parameter $t_{1}$, of a $t_{3}^{0}$-curve:

$$
\begin{equation*}
Y-\bar{Y}_{0}\left(t_{1}, t_{3}^{(0)}\right)=\bar{\Phi}\left(t_{1}, t_{3}^{(0)}\right)\left\{X-\bar{X}_{0}\left(t_{1}, t_{3}^{(0)}\right)\right\}, \tag{14}
\end{equation*}
$$

where $\bar{X}_{0}, \bar{Y}_{0}$ and $\bar{\Phi}$ are certain functions of $t_{1}$ and $t_{3}^{(0)}$, respectively.
Differentiating (14) partially with respect to $t_{1}$, we have

$$
\begin{equation*}
-\frac{\partial \bar{Y}_{0}}{\partial t_{1}}=\frac{\partial \bar{\Phi}}{\partial t_{1}}\left(X-\bar{X}_{0}\right)-\bar{\Phi} \frac{\partial \bar{X}_{0}}{\partial t_{1}} . \tag{15}
\end{equation*}
$$

Hence, eliminating $t_{1}$ from (14) and (15), we have an equation of the form

$$
\begin{equation*}
G\left(X, Y, t_{3}^{(0)}\right)=0 \tag{16}
\end{equation*}
$$

which is an equation of a $t_{3}^{(0)}$-curve (Fig. 1).

Fig. 1. Skeleton of the contact tangential chart by the enveloping method.

Writing $x, y, t_{3}$ for $X, Y, t_{3}^{(0)}$ in (16), we have the required equation of the family of $\left(t_{3}\right)$-curves:

$$
\begin{equation*}
G\left(x, y, t_{3}\right)=0 ; \tag{17}
\end{equation*}
$$

and finally we have obtained the three required equations, representing our contact tangential chart of the given functional equation (1), that is,

$$
\begin{equation*}
\left(t_{1}\right): \quad x=f_{1}\left(t_{1}, \alpha\right), \quad y=g_{1}\left(t_{1}, \alpha\right) \tag{2}
\end{equation*}
$$

$$
\begin{equation*}
\left(t_{2}\right): \quad x=f_{2}\left(t_{2}, \beta\right), \quad y=g_{2}\left(t_{2}, \beta\right) ; \tag{3}
\end{equation*}
$$

$$
\begin{equation*}
\left(t_{3}\right): \quad G\left(x, y, t_{3}\right)=0 . \tag{17}
\end{equation*}
$$

Or again we have three pairs of parametric equations,

$$
\begin{array}{lll}
\left(t_{1}\right): & x=f_{1}\left(t_{1}, \alpha\right), & y=g_{1}\left(t_{1}, \alpha\right) ; \\
\left(t_{2}\right): & x=f_{2}\left(t_{2}, \beta\right), & y=g_{2}\left(t_{2}, \beta\right) ; \\
\left(t_{3}\right): & x=f_{3}\left(t_{3}, \gamma\right), & y=g_{3}\left(t_{3}, \gamma\right) . \tag{18}
\end{array}
$$

Example 1. We construct a contact tangential chart of the relation

$$
\begin{equation*}
t_{1}^{2}+t_{2}^{2}=t_{3}^{2} \quad\left(t_{1}, t_{2}, t_{3}>0\right) \tag{19}
\end{equation*}
$$

Letting the parametric equations of $\left(t_{1}\right)$ - and $\left(t_{2}\right)$-curves be

$$
\begin{array}{lll}
\left(t_{1}\right): & x=t_{1}^{2} \cos \alpha-a, \quad y=t_{1}^{2} \sin \alpha \quad(0<\alpha<\pi) \\
\left(t_{2}\right): & x=t_{2}^{2} \cos \beta+a, \quad y=t_{2}^{2} \sin \beta \quad(0<\beta<\pi), \tag{21}
\end{array}
$$

each of these equations represents a family of concentric circles (Fig. 2).
Calculating (7) and (8) by means of (20) and (21), we obtain, respectively,

$$
\begin{align*}
\alpha & =\beta  \tag{22}\\
\cos \alpha\left(t_{2}^{2}+a \cos \beta\right) & =\cos \beta\left(t_{1}^{2}-a \cos \alpha\right) \tag{23}
\end{align*}
$$

From these expressions, we have

$$
\begin{align*}
& \alpha=\cos ^{-1}\left(\frac{t_{1}^{2}-t_{2}^{2}}{2 a}\right)  \tag{24}\\
& \beta=\cos ^{-1}\left(\frac{t_{1}^{2}-t_{2}^{2}}{2 a}\right) \tag{25}
\end{align*}
$$

Hence according to (11), the equation of the straight line passing through the points $\left(t_{1}^{2} \cos \alpha-a, t_{1}^{2} \sin \alpha\right),\left(t_{2}^{2} \cos \beta+a, t_{2}^{2} \sin \beta\right)$ is

$$
\begin{equation*}
Y-t_{1}^{2} \sin \alpha=\frac{t_{2}^{2} \sin \beta-t_{1}^{2} \sin \alpha}{\left(t_{2}^{2} \cos \beta+a\right)-\left(t_{1}^{2} \cos \alpha-a\right)}\left\{X-\left(t_{1}^{2} \cos \alpha-a\right)\right\} \tag{26}
\end{equation*}
$$

Substituting (22) into the above expression, we have

$$
\begin{equation*}
\left(t_{1}^{2}-t_{2}^{2}\right) \sin \alpha \cdot X-\left\{\left(t_{1}^{2}-t_{2}^{2}\right) \cos \alpha-2 a\right\} Y-\left(t_{1}^{2}+t_{2}^{2}\right) a \sin \alpha=0 . \tag{27}
\end{equation*}
$$

Again substituting (24) into (27), we obtain after some calculations

$$
\begin{align*}
\left(t_{1}^{2}-t_{2}^{2}\right) & \sqrt{ }\left(4 a^{2}-\left(t_{1}^{2}-t_{2}^{2}\right)^{2}\right) X-\left\{\left(t_{1}^{2}-t_{2}^{2}\right)^{2}-4 a^{2}\right\} Y-  \tag{28}\\
& -\left(t_{1}^{2}+t_{2}^{2}\right) \sqrt{ }\left(4 a^{2}-\left(t_{1}^{2}-t_{2}^{2}\right)^{2}\right) a=0 .
\end{align*}
$$

Putting $t_{3}=t_{3}^{(0)}=$ const. in the given relation (19), we have

$$
\begin{equation*}
t_{2}^{2}=t_{3}^{(0)^{2}}-t_{1}^{2} \tag{29}
\end{equation*}
$$

and substituting (29) into (28), we obtain

$$
\begin{equation*}
t \sqrt{ }\left(4 a^{2}-t^{2}\right) X+\left(4 a^{2}-t^{2}\right) Y-a t_{3}^{(0)^{2}} \sqrt{ }\left(4 a^{2}-t^{2}\right)=0 \tag{30}
\end{equation*}
$$

where

$$
\begin{equation*}
t \equiv 2 t_{1}^{2}-t_{3}^{(0)^{2}} \tag{31}
\end{equation*}
$$

Differentiating (30) partially with respect to $t_{1}$, we also obtain

$$
\begin{equation*}
2\left(2 a^{2}-t^{2}\right) X-2 t \sqrt{ }\left(4 a^{2}-t^{2}\right) Y+a t t_{3}^{(0)^{2}}=0 \tag{32}
\end{equation*}
$$

Hence, eliminating $t$ from (30) and (32), and rewriting with $t_{3}^{(0)}=t_{3}$, we have the required equation of the $\left(t_{3}\right)$-curves in the $x y$-plane:

$$
\begin{equation*}
x^{2}+y^{2}=\left(\frac{t_{3}^{2}}{2}\right)^{2} \tag{33}
\end{equation*}
$$

and this is nothing but the equation of concentric circles $\left(t_{3}\right)$ with the origin as their centers.

Fig. 2. shows our required contact tangential chart of the given relation (19).

Fig. 2. Contact tangential chart of $t_{1}^{2}+t_{2}^{2}=t_{3}^{2}$. The figure shows that $t_{1}=6, t_{2}=8 \Rightarrow t_{3}=10$.

Remark 1. Our contact tangential charts of three variables being the dual of the concurrent charts consisting of three families of curves, we can construct the contact tangential charts automatically by the method of Adams' Scanner [4].

## 3. Contact tangential charts consisting of one curvilinear scale and two families of envelopes

Let the general functional relation of three variables (1) be given. We assume the following two pairs of equations:

$$
\begin{array}{lll}
\left(t_{1}\right): & x=f_{1}\left(t_{1}\right), & y=g_{1}\left(t_{1}\right) \\
\left(t_{2}\right): & x=f_{2}\left(t_{2}, \alpha\right), & y=g_{2}\left(t_{2}, \alpha\right) \tag{35}
\end{array}
$$

and the assumptions for $f_{i}, g_{i}(i=1,2)$ are similar to those for the equations (2) and (3).

Geometrically speaking, in this case the family of curves which is expressed by (2) degenerates into a curvilinear support, expressed by (34).

Firstly, the equation of the family of tangents of a $t_{2}$-curve of $\left(t_{2}\right)$-curves is expressed by

$$
\begin{equation*}
Y-g_{2}\left(t_{2}, \alpha\right)=\left(\frac{\partial g_{2}}{\partial \alpha} / \frac{\partial f_{2}}{\partial \alpha}\right)\left\{X-f_{2}\left(t_{2}, \alpha\right)\right\} \tag{36}
\end{equation*}
$$

Fig. 3. Skeleton of the contact tangential chart consisting of one curvilinear scale and two familics of envelopes.
and if one of these tangents passes through a scaled point $t_{1}$ of $\left(t_{1}\right)$-curvilinear scales, we have

$$
\begin{equation*}
g_{1}\left(t_{1}\right)-g_{2}\left(t_{2}, \alpha\right)=\left(\frac{\partial g_{2}}{\partial \alpha} / \frac{\partial f_{2}}{\partial \alpha}\right)\left\{f_{1}\left(t_{1}\right)-f_{2}\left(t_{2}, \alpha\right)\right\} . \tag{37}
\end{equation*}
$$

Solving the above equation with respect to $\alpha$, we may obtain the following functional form:

$$
\begin{equation*}
\alpha=\alpha\left(t_{1}, t_{2}\right) \tag{38}
\end{equation*}
$$

On the other hand, the equation of the straight line passing through two points $\left\{f_{1}\left(t_{1}\right), g_{1}\left(t_{1}\right)\right\}$ and $\left\{f_{2}\left(t_{2}, \alpha\right), g_{2}\left(t_{2}, \alpha\right)\right\}$ is

$$
\begin{equation*}
Y-g_{1}\left(t_{1}\right)=\frac{g_{2}\left(t_{2}, \alpha\right)-g_{1}\left(t_{1}\right)}{f_{2}\left(t_{2}, \alpha\right)-f_{1}\left(t_{1}\right)}\left\{X-f_{1}\left(t_{1}\right)\right\} . \tag{39}
\end{equation*}
$$

Substituting (38) into (39), we have an equation which represents the straight line that passes through the point $\left\{f_{1}\left(t_{1}\right), g_{1}\left(t_{1}\right)\right\}$, and is tangential to a $t_{2}$-curve $\left\{f_{2}\left(t_{2}, \alpha\right)\right.$, $\left.g_{2}\left(t_{2}, \alpha\right)\right\}$; that is,

$$
\begin{equation*}
Y-g_{1}\left(t_{1}\right)=\Phi\left(t_{1}, t_{2}\right)\left\{X-f_{1}\left(t_{1}\right)\right\} \tag{40}
\end{equation*}
$$

Again substituting (13) into the above expression, we have

$$
\begin{equation*}
Y-g_{1}\left(t_{1}\right)=\bar{\Phi}\left(t_{1}, t_{3}^{(0)}\right)\left\{X-f_{1}\left(t_{1}\right)\right\} . \tag{41}
\end{equation*}
$$

Differentiating this expression partially with respect to $t_{1}$, and eliminating $t_{1}$ from the expression and (41), and, furthermore, writing $x, y, t_{3}$ for $X, Y, t_{3}^{(0)}$, we obtain the required equation of the family of $\left(t_{3}\right)$-curves:

$$
\begin{equation*}
G\left(x, y, t_{3}\right)=0, \tag{42}
\end{equation*}
$$

or

$$
\begin{equation*}
\left(t_{3}\right): \quad x=f_{3}\left(t_{3}, \beta\right), \quad y=g_{3}\left(t_{3}, \beta\right), \tag{43}
\end{equation*}
$$

where $\beta$ is a parameter of every $t_{3}$-curve.
Hence we have obtained the required three pairs of equations (34), (35) and (42) or (43), representing our contact tangential chart consisting of one curvilinear scale and two families of envelopes (Fig. 3).

Example 2. Construct a contact tangential chart of Ohm's law

$$
\begin{equation*}
\frac{E}{R}=I, \tag{44}
\end{equation*}
$$

where $E \in\langle 1 ; 100\rangle,[\mathrm{V}] ; R \in\langle 1 ; 5\rangle,[\Omega] ; I \in\langle 2 ; 10\rangle,[\mathrm{A}]$.

Let the parametric equations of $(E)$ - and $(R)$-curves be, respectively,
$(E): \quad x=-m E, \quad y=0$;

$$
\begin{equation*}
(R): \quad x=R^{2} \alpha^{2}+R^{2}, \quad y=2 R^{2} \alpha \quad(\alpha>0), \tag{45}
\end{equation*}
$$

where $m$ is a scale modulus of rectilinear functional scale of $(E)$, and $\alpha$ the parameter of parabolas $(R)$.
The equation of the family of tangents of an $R$-parabola is obtained from (36) in the form

$$
\begin{equation*}
X-\alpha Y+R^{2} \alpha^{2}-R^{2}=0 ; \tag{47}
\end{equation*}
$$

and if one of these tangents passes through a scaled point ( $-m E, 0$ ), we have from (37)

$$
\begin{equation*}
-m E+R^{2} \alpha^{2}-R^{2}=0 . \tag{48}
\end{equation*}
$$

Solving (48) with respect to $\alpha(\alpha>0)$, we obtain

$$
\begin{equation*}
\alpha=\frac{1}{R} \sqrt{ }\left(R^{2}+m E\right) . \tag{49}
\end{equation*}
$$

Fig. 4. Contact tangential chart of $E / R=I$. The figure shows that $E=24 \mathrm{~V}, R=3 \Omega \Rightarrow I=8 \mathrm{~A}$.

On the other hand, generally, the equation of the straight line passing through two points $(-m E, 0)$ and ( $\left.R^{2} \alpha^{2}+R^{2}, 2 R^{2} \alpha\right)$ is, from (39),

$$
\begin{equation*}
2 R^{2} \alpha X-\left(R^{2} \alpha^{2}+R^{2}+m E\right) Y+2 R^{2} \alpha m E=0 . \tag{50}
\end{equation*}
$$

Substituting (49) into (50), we obtain

$$
\begin{equation*}
R X-\sqrt{ }\left(R^{2}+m E\right) Y+R m E=0 . \tag{51}
\end{equation*}
$$

Eliminating $R$ from the above expression and the given functional relation (44) we have

$$
\begin{equation*}
E X-\sqrt{ }\left(E^{2}+m E I^{2}\right) Y+m E^{2}=0 \tag{52}
\end{equation*}
$$

and this is nothing but the equation of straight lines enveloping an $I$-curve, with parameter $E$.

Then, differentiating (52) partially with respect to $E$, we have

$$
\begin{equation*}
2 \sqrt{ }\left(E^{2}+m E I^{2}\right) X-\left(2 E+m I^{2}\right) Y+4 m E \sqrt{ }\left(E^{2}+m E I^{2}\right)=0 \tag{53}
\end{equation*}
$$

From (52) and (53) we obtain, finally a parametric representation of (I)-curves, with parameter $E$ :

$$
\begin{equation*}
(I): \quad x=-\frac{E\left(2 E+3 m I^{2}\right)}{I^{2}}, \quad y=-\frac{2 E \sqrt{ }\left(E^{2}+m E I^{2}\right)}{I^{2}}, \tag{54}
\end{equation*}
$$

writing $x, y$ for $X, Y$.
Or, eliminating $E$ from the two expressions of (54), we have an algebraic equation of the fourth degree with respect to $x$ and $y$, representing $(I)$-curves, that is,

$$
\begin{equation*}
4 x^{4}-8 x^{2} y^{2}+4 y^{4}-4 a^{2} x^{3}+36 a^{2} x y^{2}-27 a^{4} y^{2}=0 \tag{55}
\end{equation*}
$$

where $a \equiv m I$.
Hence we have obtained three pairs of equations (45), (46) and (54), representing our required contact tangential chart, which is shown in Fig. 4.

Remark 2. Contact tangential charts consisting of two curvilinear scales and one family of envelopes were already studied by Edward Otto [1].

## 4. Contact tangential charts of four variables or more

Let the given functional relation of four variables be

$$
\begin{equation*}
F_{1234}\left(t_{1}, t_{2}, t_{3}, t_{4}\right)=0 . \tag{56}
\end{equation*}
$$

Assuming that the above expression is separable into the following two equations

$$
\begin{equation*}
f\left(t_{1}, t_{2}, t_{0}\right)=0, \quad g\left(t_{3}, t_{4}, t_{0}\right)=0, \tag{57}
\end{equation*}
$$

where $t_{0}$ is a parameter, we have two contact tangential charts from the theory of preceding sections, that is, one consisting of $\left(t_{1}\right)-,\left(t_{2}\right)$ - and $\left(t_{0}\right)$-curves, the other of $\left(t_{3}\right)$-, $\left(t_{4}\right)$-, and $\left(t_{0}\right)$-curves.

Fig. 5. Skeleton of the double contact tangential chart of four variables.
Thus obtained double contact tangential chart and the method of solution of the chart are shown in Fig. 5, where ( $t_{0}$ )-curves are those with no scale.

It is clear that the contact tangential charts of five variables or more can be constructed analogously.

## Souhrn

# METODA KONSTRUKCE OBECNÝCH DOTYKOVÝCH NOMOGRAMU゚ 

Katuhiko Morita, Osamu Saté

Budiž $F_{123}$ reálná funkce tří reálných proměnných $t_{1}, t_{2}$ a $t_{3}$. V článku je uvedena metoda konstrukce dotykového nomogramu vztahu $F_{123}=0$ metodou obálek. Jsou-li dány parametrické rovnice $\left(t_{1}\right)$ - a $\left(t_{2}\right)$-křivek, je možno získat parametrickou rovnici $\left(t_{3}\right)$-křivek klasickou diferenciálně geometrickou metodou. Je uvedeno několik příkladu.

Dále je vyšetřován speciální případ obecných dotykových nomogramů, složených z jedné křivé stupnice a dvou soustav obálek.
V závěru se zkoumají dotykové nomogramy čtyř a více proměnných.
