# A SIMPLE PROOF OF A SEMI-FREDHOLM PRINCIPLE FOR PERIODICALLY FORCED SYSTEMS WITH HOMOGENEOUS NONLINEARITIES 

J. MAWHIN<br>(Received December 28, 1988)

In honour of the $60^{\text {th }}$ birthday anniversary of Prof. M. Ráb

#### Abstract

We prove that a generalized version of a semi-Fredholm principle for the existence of periodic solutions for forced systems with homogeneous nonlinearities recently obtained by Lazer and McKenna can be proved by a simple homotopy argument, which answers a question raised by those authors.

Key words. Periodic solution, periodically forced system, semi-Fredholm principle.
MS Classification. 34 C 25.

## 1. INTRODUCTION

In a recent paper, Lazer and McKenna [1] have proved the existence of $T$-periodic solutions for systems of the form

$$
\begin{equation*}
u^{\prime \prime}(t)+V^{\prime}(u(t))=p(t) \tag{1}
\end{equation*}
$$

when $V \in C^{1}\left(\mathbf{R}^{n}, \mathbf{R}\right)$ is positively homogeneous of degree two, positive semidefinite and $p \in C^{1}\left(\mathbf{R}, \mathbf{R}^{n}\right)$ is $T$-periodic. They use Leray - Schauder degree theory together with two perturbations arguments through systems of the form

$$
\begin{equation*}
u^{\prime \prime}(t)+\varepsilon u^{\prime}(t)+V^{\prime}(u(t))=p(t) \tag{2}
\end{equation*}
$$

with $\varepsilon>0$ and $V$ positive definite and

$$
\begin{equation*}
u^{\prime \prime}(t)+\delta u(t)+V^{\prime}(u(t))=p(t) \tag{3}
\end{equation*}
$$

with $\delta>0$ and $V$ positive semidefinite. They remark that it does not seem possible to prove the theorem more directly by connecting (1) rather (2) to a linear equation by a homotopy.

We show in this paper that it is indeed possible and, without further complication, we can deal with a more general system which may also depend nonlinearly of $u^{\prime}$.

## 11. A SEMI-FREDHOLM PRINCIPLE FOR PERIODIC SOLUTIONS OF FORCED SYSTEMS WITH HOMOGENEOUS NONLINEARITIES

Recall that a function $W: \mathbf{R}^{n} \rightarrow \mathbf{R}$ is said to be positive (resp. negative) semidefinite if $W(x) \geqq 0$ (resp. $W(x) \leqq 0$ ) for all $x \in \mathbf{R}^{n}$, and is said to be positively homogeneous of degree $k \geqq 0$ if $W(t x)=t^{k} W(x)$ for all $t \geqq 0$ and $x \in \mathbf{R}^{n}$. We shall call $W$ semidefinite if it is either positive or negative semidefinite. Recall also that if $W \in C^{\mathbf{1}}\left(\mathbf{R}^{n}, \mathbf{R}\right)$ and positive homogeneous of degree $k \geqq 1$, then Euler's. identity implies that

$$
\left(x, W^{\prime}(x)\right)=k W(x)
$$

for all $x \in \mathbf{R}^{n}$. Of course, $W^{\prime}$ denotes the gradient of $W$ and $(x, y)$ the inner product of $x$ and $y$ in $\mathbf{R}^{n}$.

We may now state and prove in a direct way a semi-Fredholm principle in the sense of Lazer - McKenna for a larger class of systems.

Theorem 1. If $U$ and $V$ are in $C^{1}\left(\mathbf{R}^{n}, \mathbf{R}\right)$, positive homogeneous of degree two, semidefinite and such that the system

$$
\begin{equation*}
u^{\prime \prime}(t)+U^{\prime}\left(u^{\prime}(t)\right)+V^{\prime}(u(t))=0 \tag{4}
\end{equation*}
$$

has no $T$-periodic solution other than 0 , then for each $p \in L^{1}\left(0, T ; \mathbf{R}^{n}\right)$ the problem

$$
\begin{gather*}
u^{\prime \prime}(t)+U^{\prime}\left(u^{\prime}(t)\right)+V^{\prime}(u(t))=p(t)  \tag{5}\\
u(0)-u(T)=u^{\prime}(0)-u^{\prime}(T)=0
\end{gather*}
$$

has at least one solution.
Proof. Let $a= \pm 1$ and $b= \pm 1$ be such that $a U$ and $b V$ are positive semidefinite. Observe that the linear system

$$
\begin{equation*}
u^{\prime \prime}(t)+a u^{\prime}(t)+b u(t)=0 \tag{6}
\end{equation*}
$$

has no $T$-periodic solution other than 0 , because if $u$ is any $T$-periodic solution of (6), then, taking the inner product of (6) with $u^{\prime}(t)$, integrating over $[0, T]$ and using the periodicity, we get

$$
a \int_{0}^{T}\left|u^{\prime}(t)\right|^{2} \mathrm{~d} t=0
$$

so that $u$ is constant, and this constant must be zero as shown by integrating (6) over [ $0, T$ ]. Consequently, it follows from one version of the Leray - Schauder's continuation theorem (see e.g. [2], Theorem IV.5) that (5) will have at least one solution if we can find $r>0$ such that for each $\lambda \in[0,1]$ and each possible solution $u$ of the problem

$$
\begin{gather*}
u^{\prime \prime}(t)+(1-\lambda)\left(a u^{\prime}(t)+b u(t)\right)+\lambda\left[U^{\prime}\left(u^{\prime}(t)\right)+V^{\prime}(u(t))\right]=\lambda p(t) \\
u(0)-u(T)=u^{\prime}(0)-u^{\prime}(T)=0 \tag{7}
\end{gather*}
$$

one has $\|u\|_{1}<r$, where

$$
\|u\|_{1}=\max _{t \in[0, T]}|u(t)|+\max _{t \in[0, T]}\left|u^{\prime}(t)\right|
$$

If it is not the case, we can find sequences $\left(\lambda_{k}\right)$ in $[0,1]$ and $\left(u_{k}\right)$ in $C^{1}\left([0, T], \mathbf{R}^{n}\right)$ such that $\left\|u_{k}\right\|_{1}>k$ and $u_{k}$ is a solution of (7) with $\lambda=\lambda_{k}$ ( $k \in \mathrm{~N}^{*}$ ). Letting $w_{k}=u_{k} /\left\|u_{k}\right\|_{1}$, so that $\left\|w_{k}\right\|_{1}=1$, for all $k \in \mathrm{~N}$, and using the positive homogenity of degree one of $U^{\prime}$ and $V^{\prime}$, we get

$$
\begin{gather*}
w_{k}^{\prime \prime \prime}(t)+\left(1-\lambda_{k}\right)\left(a w_{k}^{\prime}(t)+b w_{k}(t)\right)+\lambda_{k}\left[U^{\prime}\left(w_{k}^{\prime}(t)\right)+V^{\prime}\left(u_{k}(t)\right)\right]= \\
=\lambda_{k}\left(p(t) /\left\|u_{k}\right\|_{1}\right)  \tag{8}\\
w_{k}(0)-w_{k}(T)=w_{k}^{\prime}(0)-w_{k}^{\prime}(T)=0
\end{gather*}
$$

for all $k \in \mathbf{N}^{*}$, which immediately implies that the sequence $\left(\left\|w_{k}^{\prime \prime}\right\|_{L^{1}}\right)$ is bounded independently of $k$. Hence, the sequences $\left(w_{k}\right)$ and ( $w_{k}^{\prime}$ ) are equibounded and equiuniformly continuous on $[0, T]$, and Ascoli-Arzela's theorem implies the existence of subsequences $\left(\lambda_{j_{k}}\right)$ of $\left(\lambda_{k}\right),\left(w_{j_{k}}\right)$ of $\left(w_{k}\right)$ and of $w \in C^{1}\left([0, T], \mathbf{R}^{n}\right)$ verifying

$$
\begin{equation*}
w(0)-w(T)=w^{\prime}(0)-w^{\prime}(T)=0 \tag{9}
\end{equation*}
$$

and such that $w_{j_{k}} \rightarrow w$ and $w_{j_{k}}^{\prime} \rightarrow w^{\prime}$ uniformly on $[0, T]$ and $\lambda_{j_{k}} \rightarrow \lambda^{*}$ for some $\lambda^{*} \in[0,1]$. Therefore, if we take the integrated form, from 0 to $t$, of the differential system in (8) for $k=j_{k}$ and let $k \rightarrow \infty$, we see that

$$
w^{\prime}(t)-w^{\prime}(0)+\int_{0}^{t}\left\{\left(1-\lambda^{*}\right)\left(a w^{\prime}(s)+b w(s)\right)+\lambda^{*}\left[U^{\prime}\left(w^{\prime}(s)\right)+V^{\prime}(w(s))\right]\right\} \mathrm{d} s=0
$$

for all $t \in[0, T]$, and hence $w^{\prime}$ is absolutely continuous on $[0, T]$ and satisfies the differential equation

$$
\begin{equation*}
w^{\prime \prime}(t)+\left(1-\lambda^{*}\right)\left(a w^{\prime}(t)+b w(t)\right)+\lambda^{*}\left[U^{\prime}\left(w^{\prime}(t)\right)+V^{\prime}(w(t))\right]=0 \tag{10}
\end{equation*}
$$

If $\lambda^{*}=1$, it follows from the assumption on (4) that $w=0$, a contradiction with $\|w\|_{1}=1$. If $0 \leqq \lambda^{*}<1$, then, taking the inner product of (10) with $w^{\prime}(t)$, integrating over [ $0, T$ ] and using the conditions (9), we get

## J. MAWHIN

$$
\left(1-\lambda^{*}\right) a \int_{0}^{T}\left|w^{\prime}(t)\right|^{2} \mathrm{~d} t+\lambda^{*} \int_{0}^{T}\left(U^{\prime}\left(w^{\prime}(t), w^{\prime}(t)\right) \mathrm{d} t=0\right.
$$

i.e.

$$
\left(1-\lambda^{*}\right) \int_{0}^{T}\left|w^{\prime}(t)\right|^{2} \mathrm{~d} t+2 a \lambda^{*} \int_{0}^{T} U\left(w^{\prime}(t)\right) \mathrm{d} t=0
$$

which implies, by the positive semidefiniteness of $a U$ that

$$
\int_{0}^{T}\left|w^{\prime}(t)\right|^{2} \mathrm{~d} t=0
$$

and hence that $w$ is constant on $[0, T]$, say $w(t)=\bar{w}$ for all $t \in[0, T]$. But then (10) implies, after an inner product with $w$,

$$
\left(1-\lambda^{*}\right) b|\bar{w}|^{2}+\lambda^{*}\left(V^{\prime}(\bar{w}), \bar{w}\right)=0
$$

i.e.

$$
\left(1-\lambda^{*}\right)|\bar{w}|^{2}+2 \lambda^{*} a V(\bar{w})=0
$$

so that $\bar{w}=0$, as $a V$ is positive semidefinite, and hence $w=0$, a contradiction with $\|w\|_{1}=1$. Hence, the proof is complete.
